

Kohta Ueno

Building Science of Walls

June 6, 2017

Background

Environmental Separator

What Separation Roles?

- Water control layer
 - A.k.a. “drainage plane,” “water resistive barrier,” “weather resistive barrier,” WRB
 - Housewraps, tar paper... more modern options
- Air control layer
 - A.k.a. “air barrier”
 - Drywall, sheathing, spray foam... and continuity
- Vapor control layer
 - A.k.a. “vapor barrier”—poly, Kraft paper, latex paint
- Thermal control layer
 - Insulation (fluffy in stud bays, continuous on outside)

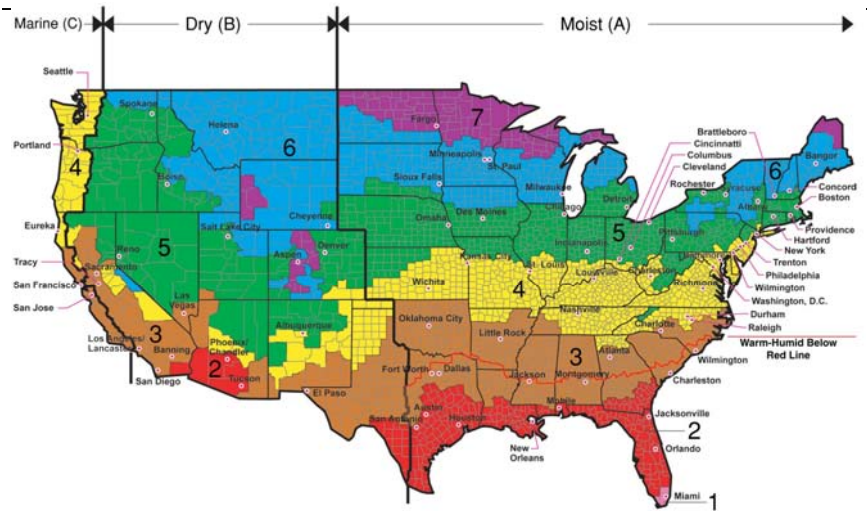

Climate Zone Map (BSC)

2017-06 Portland ME Huber Presentation

5

Climate Zone Map (DOE)

All of Alaska in Zone 7 except for the following Boroughs in Zone 8: Bethel, Dillingham, Fairbanks, N. Star, Nome North Slope, Northwest Arctic, Southeast Fairbanks, Wade Hampton, and Yukon-Koyukuk.

Zone 1 includes: Hawaii, Guam, Puerto Rico, and the Virgin Islands

2017-06 Portland ME Huber Presentation

6

Water Control Layer

2017-06 Portland ME Huber Presentation

7

Housewrap (Residential)

2017-06 Portland ME Huber Presentation

8

Housewrap (Commercial)

Billowing Housewrap

- Is it really an air barrier (network airflow)?
- Potential damage from cyclic loading

Vapor-Impermeable Adhered Membrane

- Cold climate + no exterior insulation = danger

2017-06 Portland ME Huber Presentation

11

Vapor-Permeable Adhered Membrane

2017-06 Portland ME Huber Presentation

12

Self-Adhered Membranes

- Self-sealing
- Air leakage improvement; no blow-off/billowing
- No 'hidden path' water leakage/bypass
- Reverse laps not as critical

Taped Sheathings (WRB Surface)

- Fast dry-in
- Airtightness
- Reliance on adhesive vs. laps? Surface prep
- Rigid foam insulation too

Taped Joints (Foam Sheathing)

- Membrane-type flashing tape at joints
- Horizontals more important than verticals

Fluid-Applied WRBs

- “Housewrap in a can” (GBA Column)
- Continuous water control
- Airtightness
- Can be applied with air gun (paint sub)
- Issues: surface prep, application temperature, substrate condition, etc.

Reverse Lap Termination

- “Termination mastic” at reverse lap condition

Water Control- Hydrostatic Pressure

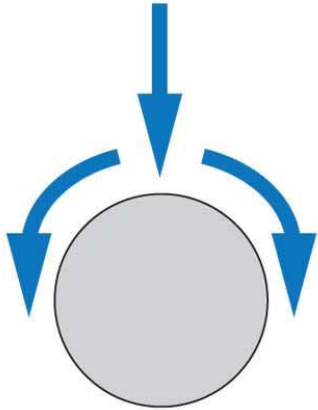

Water Control and Drainage Gaps

- Water control layer
- Key is control of hydrostatic pressure
- All about “the gap”

- See “Mind the Gap” and “Hockey Pucks and Hydrostatic Pressure”

Hydrostatic Pressure

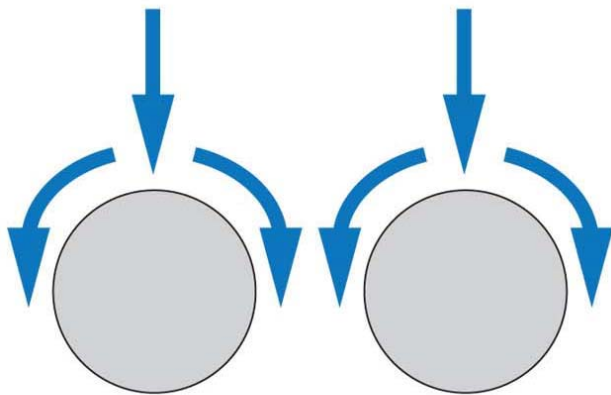

A diagram showing a single gray sphere. A solid blue arrow points vertically downwards towards the top of the sphere. Two curved blue arrows originate from the top edge of the sphere and point outwards and downwards, suggesting a lateral force or rotation.

bsc Building Science Corporation

2017-06 Portland ME Huber Presentation

25

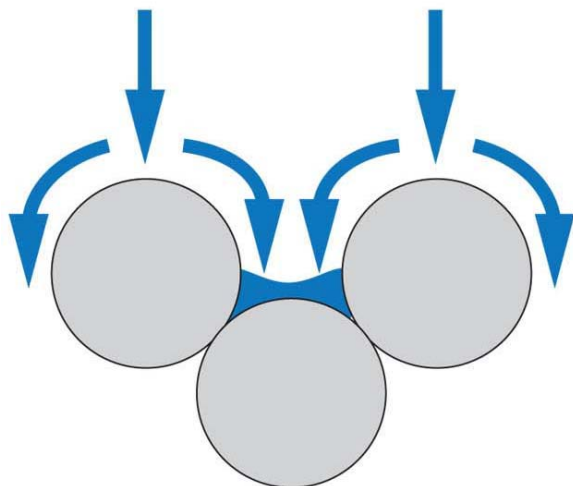

A diagram showing two gray spheres side-by-side. Each sphere has a solid blue arrow pointing vertically downwards towards its top. Each sphere also has two curved blue arrows originating from its top edge and pointing outwards and downwards, identical to the diagram on the previous slide.

bsc Building Science Corporation

2017-06 Portland ME Huber Presentation

26

The diagram shows three gray circles arranged in a triangular pattern. Two circles are at the top, and one is centered below them. Two blue arrows point vertically downwards towards the top of each of the upper circles. From the top of each of these two circles, two blue curved arrows point outwards and downwards, away from the center of the arrangement.

bsc Building Science Corporation

2017-06 Portland ME Huber Presentation

27

The photograph shows a close-up of a brick wall. The bricks are reddish-brown. Large, irregular, and somewhat lumpy patches of gray mortar or concrete have been applied over the bricks, particularly in the center and lower-left areas, obscuring the original brickwork.

2017-06 Portland ME Huber Presentation

28

Wind Speed vs. Pressures

- 1/2" of "perched" water \approx 35 mph wind force

Water Control Layers and Spaces

Strapped Cavities/“Rainscreen Wall”

Why Rainscreen/Air Gap

- “Sandwiched” water (surface tension) hangs up
- Staying wet or wet/dry cycling
 - Paint blow off
 - Damage over time

Cladding Ventilation

- Airflow behind cladding dries out both cladding & backup wall
- Brick veneer example
- Why vinyl siding and metal panel cladding work in cold climates

Drainage from Lap Sidings

- Added water between siding & housewrap
- Lap sidings “self draining”
- Window head flashings!

Shingle Wall Rainscreen/Air Gap

- Mesh style
(Home Slicker, Keene Building Products)

Windows Flashings

2017-06 Portland ME Huber Presentation

43

EIFS & Windows - Oops

Sill Pan Flashings

Backdams and Sloped Sills

A strip of wood nailed at the back of the rough opening forms a dam to prevent water from draining into the interior.

A piece of wood bevel siding nailed over the sill to create positive drainage toward the exterior is even better. Note that the rough opening needs to be enlarged to account for this and tapered shims in the opposite direction of the slope may be required.

Formable Sub-sill Flashing

Subsill

48

Housewrap Installation Sequence

2017-06 Portland ME Huber Presentation

49

Housewrap Installation Sequence

2017-06 Portland ME Huber Presentation

50

Foam Sheathing Window Flashing

2017-06 Portland ME Huber Presentation

51

Window Failure Examples

2017-06 Portland ME Huber Presentation

52

Window Failure Examples

Window Failure Repair

- Stripped shingles and housewrap
- Windows pulled, re-flashed (fluid-applied window 'wrap'), and reinstalled
- Fluid-applied WRB
- Added rainscreen mat under shingles

Stucco & Adhered Stone

Stucco on Wood Frame Walls

Stucco Failures (MN, PA)

2017-06 Portland ME Huber Presentation

57

Stucco-to-Paper Bond

58

Adhered Stone Veneer

Air Flow

Airflow Control: Why

- Moisture control
 - air leakage condensation
- Comfort and Health
 - Drafts
 - Odors, particles, gases
- Energy
 - Heat transferred with air
- Sound
- Required by some codes

*If you can't enclose air,
you can't condition it*

Driving Forces

- 1. Wind Pressures
- 2. Buoyancy (or stack effect)
- 3. HVAC

Driving Forces

2017-06 Portland ME Huber Presentation

67

Wind Flow Patterns

2017-06 Portland ME Huber Presentation

68

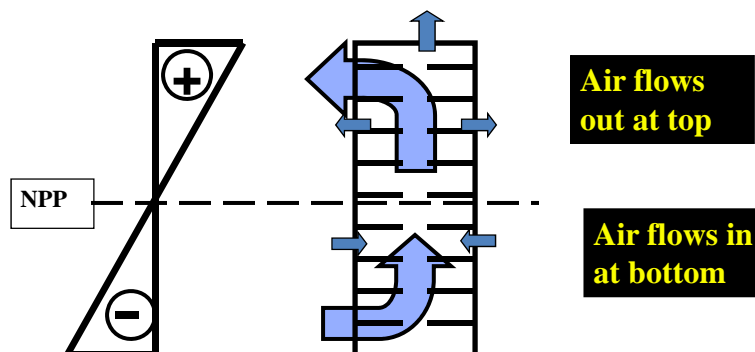

2. Stack Effect: Cold Weather

- Hot air rises
- Tall Building in Winter = Heavy Balloon

Stack Effect: Cold Weather

- “Perfect” Building equally leaky everywhere
- **Neutral Pressure Plane** at mid-height

Stack Effect: Warm Weather

- “Perfect” Building equally leaky everywhere
- **Neutral Pressure Plane** at mid-height

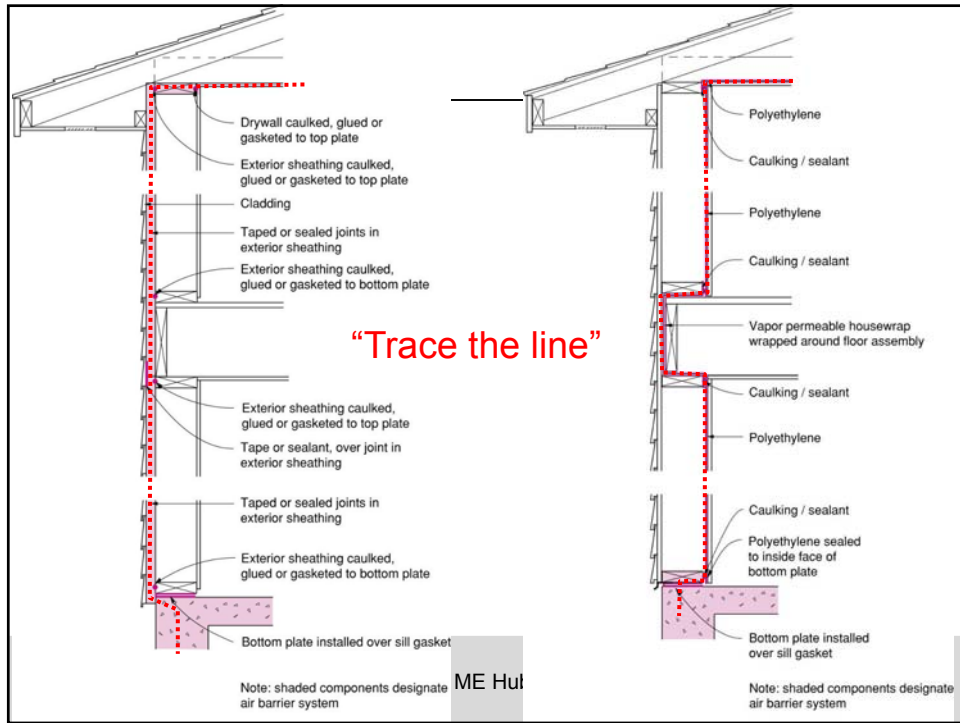

Air Barriers

Air Barrier Systems

- Function: to stop airflow through enclosure
- ABS can be placed anywhere in the enclosure
- Must be strong enough to take wind gusts (code requirement)
- Many materials are air impermeable, but most systems are not airtight

Air Barrier Systems: Requirements

- Continuous
 - primary need, common failure
- Strong
 - designed for full wind load
- Durable
 - critical component - repair, replacement
- Stiff
 - control billowing, pumping
- Air Impermeable
 - (may be vapour permeable)

The Airtight Drywall Approach

Use drywall, framing members

- Seal with sealant, gaskets, etc.
- Is stiff, strong
- Often easier to ensure quality
- Widely applicable to all forms of commercial, residential
- Allows choice of vapor permeance

Air sealing around components:
e.g., windows and walls
other
Openings and penetrations

Big holes

Spray Foam as an Air Barrier

- Spray foam doesn't air seal where it isn't there!
- Wood-to-wood connections

Spray Foam as an Air Barrier

Spray Foam as an Air Barrier

Cold Weather Condensation in Walls

Vapor Diffusion vs. Air Leakage

- Vapor Diffusion
 - more to less vapor
 - no air flow
 - flow through tiny pores
- Air Convection
 - more to less air pressure
 - flow through visible cracks and holes
 - vapor is just along for the ride

Wall w/o Insulated Sheathing

Frosting on Sheathing

Wall with Insulated Sheathing

Vapor Barriers and the Code

- Class I: 0.1 perm or less (polyethylene)
- Class II: $0.1 < \text{perm} \leq 1.0$ perm (Kraft facing, vapor retarder paint)
- Class III: $1.0 < \text{perm} \leq 10$ perm (Latex paint)
- Polyethylene = no inward drying
- More open vapor control allows greater drying—more “forgiveness” in wall

Vapor Barriers and the Code

TABLE N1102.5.1
CLASS III VAPOR RETARDERS

| Zone | Class III vapor retarders permitted for: |
|----------|---|
| Marine 4 | Vented cladding over OSB Vented cladding over plywood Vented cladding over fiberboard Vented cladding over gypsum Insulated sheathing with R-value ≥ 2.5 over 2x4 wall Insulated sheathing with R-value ≥ 3.75 over 2x6 wall |
| 5 | Vented cladding over OSB Vented cladding over plywood Vented cladding over fiberboard Vented cladding over gypsum Insulated sheathing with R-value ≥ 5 over 2x4 wall Insulated sheathing with R-value ≥ 7.5 over 2x6 wall |
| 6 | Vented cladding over fiberboard Vented cladding over gypsum Insulated sheathing with R-value ≥ 7.5 over 2x4 wall Insulated sheathing with R-value ≥ 11.25 over 2x6 wall |
| 7 and 8 | Insulated sheathing with R-value ≥ 10 over 2x4 wall Insulated sheathing with R-value ≥ 15 over 2x6 wall |

Can just use latex paint (no vapor barrier) if you add enough insulation outside of the stud bay insulation. Safer -> controls diffusion and air leakage moisture.
Zone 6A = ~40%/60% R-value ratio

Thermal Bridging at Framing

Thermal Bridging at Steel Framing

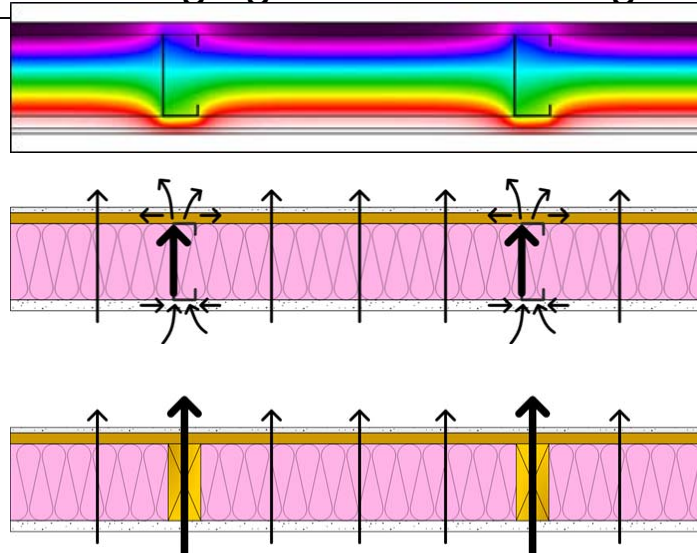

*Steel is 400 times
more conductive
than wood*

*Steel studs are
about 40 times
thinner*

*A 2x6 steel stud wall 16" OC
with R-19 Fiberglass Batt =
effective R-9 wall assembly.*

Thermal Bridging at Steel Framing

Thermal Bridging at Steel Framing

- Summertime/AC example
- Sun is hitting the wall (southeast orientation)

Exterior Continuous Insulation

Exterior Rigid Foam (Taped Seams)

4" Polyisocyanurate Foam Retrofit

Mineral Fiber, Nailbase Panel

4" Polyisocyanurate Foam

101

Foam Sheathing Cladding

250 lbs/113 kg load (7.8 psf): <0.003" deflection

Wood siding ~2 psf
Fiber cement 2-3 psf
Stucco 8-10 psf

Image c/o Petersen Engineering

2017-06 Portland ME Huber Presentation

102

Foam Sheathing Cladding Attachment

The diagram illustrates the attachment of foam sheathing to a substrate. On the left, a cross-section shows a substrate with a fastener passing through a layer of foam sheathing. The fastener is shown in its deformed position, creating a compressive 'strut' in the foam. A red arrow indicates the gravity load of the cladding. On the right, two diagrams show the force components: 'Geometry' shows a vertical displacement δ_y and a horizontal displacement δ_x ; 'Force' shows tension and compression forces acting on the fastener, with a downward arrow for gravity.

Substrate
Deformed position of fastener
Compressive "strut"
Gravity load of cladding

Geometry
 δ_y
 δ_x

Force
 Tension
 Compression
 Gravity

 103

BSC Cladding Attachment Research

- System Mechanics

The three diagrams show different mechanical resistances: 1) Shear and rotational resistance provided by fastener to wood connections, indicated by a red circular arrow and a vertical arrow. 2) Rotational resistance provided by tension in fastener and compression of the insulation, indicated by red arrows pointing outwards from the fastener. 3) Vertical movement resistance provided by friction between layers, indicated by multiple red vertical arrows pointing in opposite directions.

Shear and rotational resistance provided by fastener to wood connections

Rotational resistance provided by tension in fastener and compression of the insulation

Vertical movement resistance provided by friction between layers

 2017-06 Portland ME Huber Presentation
 104

Full System Laboratory Tests

- Looked at initial response full system capacity as well as long term sustained loading
- Used full scale samples to limit variations in fastener installation

Recommendations

- Based on the results of the testing it is currently recommended to use a maximum load per fastener of no more than 10lbs for up to 4" of insulation

| Cladding weight (psf) | 16" oc Furring | 24" oc Furring |
|--------------------------|----------------|----------------|
| 5 | 18 | 12 |
| 10 | 9 | 6 |
| 15 | 6 | 4 |
| 20 | 4 | 3 |
| 25 | 3 | 2 |

The "Perfect Wall"

The “Perfect” Wall: Higher Performance

2017-06 Portland ME Huber Presentation

121

The Commercial Steel Frame Wall

2017-06 Portland ME Huber Presentation

122

“Perfect Wall” Advantages

- Very robust enclosure—“500 year building”
 - Structural portion in “interior” conditions
- Institutional/long term buildings
- No risk of interstitial condensation
- Continuity of control layers
 - Continuous thermal insulation outside
 - Inspectable and simple air barrier “wrap”
 - Water control layer/WRB inspectable before insulation
- Any interior condition
- Any exterior condition

Building the “Perfect Wall”

Self-adhered membrane. XPS insulation

Fluid-Applied Asphalt & Rock Wool

- Asphalt Drainage Plane Air Barrier
- Rock wool Insulation

Exterior Closed Cell Spray Foam

All Four Control Layers

Spray foam= air barrier & drainage plane & insulation & vapor control

Transitions,
Continuity,
Penetrations

Cladding Support (Z-Furring)

- Z-furring 16" o.c.,
- All this effort to cover up our thermal bridges with insulation... and then we punch steel through it...

2017-06 Portland ME Huber Presentation
