Insulation - History

R2

R6

R2

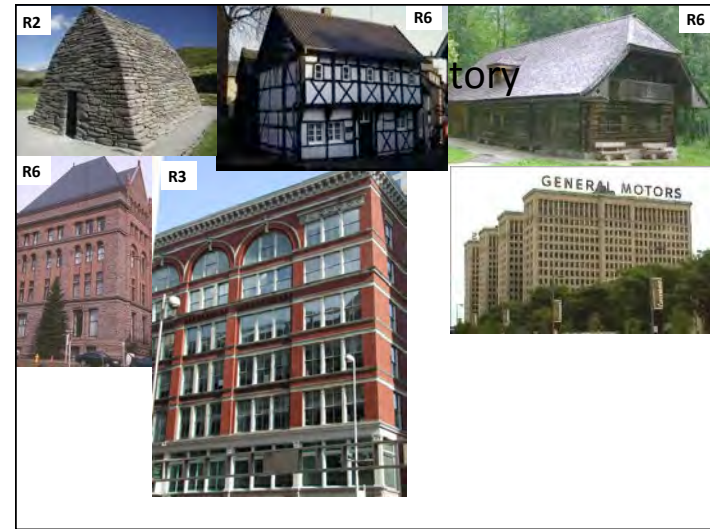

R6

R6

History

Insulation

- Thermal bridges of concrete and steel dramatically reduce performance
 - 6" steel stud, R20 batt = R5!
 - 6" wood stud, R1 batt = R14
- Windows have R-values of around 2-3. Huge heat loss
- ASHRAE 90.1-2010: $U0.084 = R11.9$ for CZ3
- Airtightness becomes very important as enclosure insulation is increased

Building Science.com

Airtighten

- Must increase airtightness
 - Improve air quality: where is it coming from?
 - Demand-controlled ventilation
 - Typical buildings leak energy
- Codes and standard are beginning to demand it
- Can only really know tightness by testing
 - Must begin to test large buildings

Building Science.com

Solar Control

- Can make little use of solar heat gain in enclosure-dominated large buildings in marine climates (insulate to keep heat in)
- Significant glass ($WWR > 30\%$) requires shade in marine climate buildings, esp. offices
- Glass area selection should be dominated by views and daylight, not solar heat gain

12/175

12-06-18

Durability

- Enclosures that control energy flow have reduce drying + increased wetting
- Must improve
 - rain control
 - Condensation control
 - Drying of construction moisture

The Enclosure: An Environmental Separator

- The part of the building that physically **separates** the **interior** and **exterior** environments.
- Includes all of the parts that make up the wall, window, roof, floor, caulked joint etc.
- Sometimes, interior partitions also are environmental separators (pools, rinks, etc.)

Building Science 2008

Enclosures No. 14 /

Climate Load Modification

- Building & Site (overhangs, trees...)
 - Creates microclimate
- Building Enclosure (walls, windows, roof...)
 - Separates climates
 - Passive modification
- Building Environmental Systems (HVAC...)
 - Use energy to change climate
 - Active modification

Basic Functions of the Enclosure

- 1. Support
 - Resist and transfer physical forces from inside and out
- 2. Control
 - Control mass and energy flows
- 3. Finish
 - Interior and exterior surfaces for people
- Distribution – a building function

Building Science

Basic Enclosure Functions

- **Support**
 - Resist & transfer physical forces from inside and out
 - Lateral (wind, earthquake)
 - Gravity (snow, dead, use)
 - Rheological (shrink, swell)
 - Impact, wear, abrasion
- **Control**
 - Control mass and energy flows
- **Finish**
 - Interior and exterior surfaces for people

Functional Layers

Building Science Enclosures No. 17 /

Basic Enclosure Functions

- **Support**
 - Resist & transfer physical forces from inside and out
- **Control**
 - **Control mass and energy flows**
 - **Rain** (and soil moisture)
 - Drainage plane, capillary break, etc.
 - **Air**
 - Continuous air barrier
 - **Heat**
 - Continuous layer of insulation
 - **Vapor**
 - Balance of wetting/drying
- **Finish**
 - Interior and exterior surfaces for people

Functional Layers

Building Science.com Enclosures No. 18 /

Other Control . . .

- **Support**
- **Control**
 - **Fire**
 - Penetration
 - Propagation
 - **Sound**
 - Penetration
 - Reflection
 - **Light**
 - Diffuse/glare
 - View
- **Finish**

Functional Layers

Building Science.com Enclosures No. 19 /

Basic Enclosure Functions

- **Support**
 - Resist & transfer physical forces from inside and out
- **Control**
 - Control mass and energy flows
- **Finish**
 - **Interior & exterior surfaces for people**
 - Color, speculance
 - Pattern, texture

Functional Layers

Building Science.com

History of Control Functions

- Older Buildings
 - One layer does everything
- Newer Building
 - Separate layers, . . . separate functions

What is a high performance enclosure?

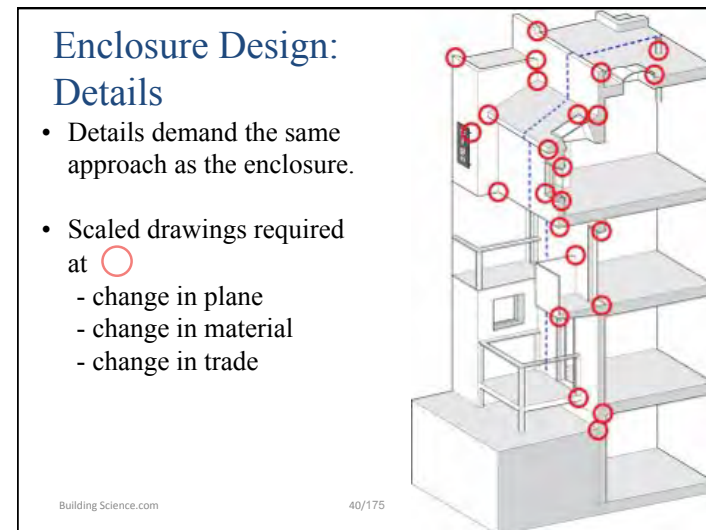

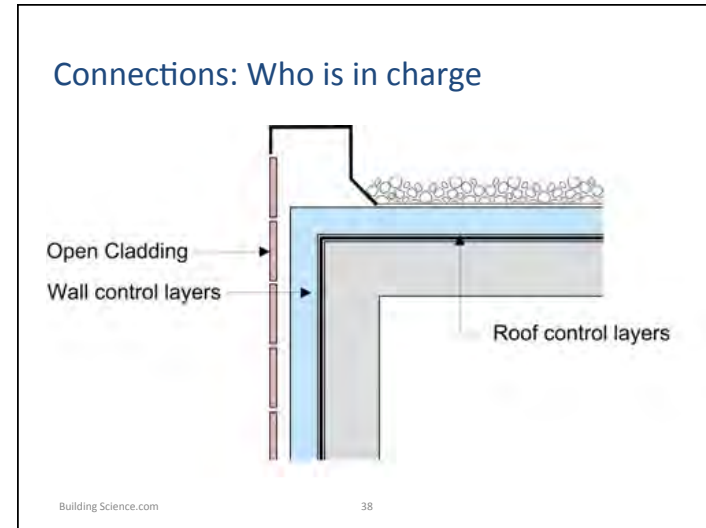

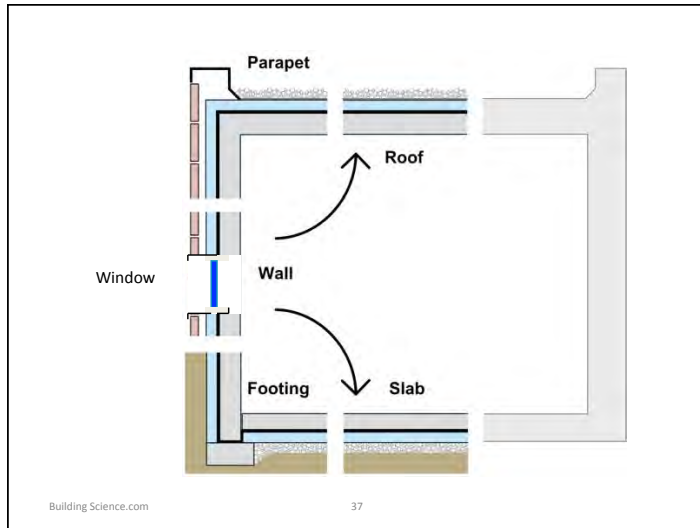

- One which provides high levels of control
- Poor continuity limits performance
- Poor continuity causes most problems too:
 - E.g. air leakage condensation
 - Rain leakage
 - Surface condensation
 - Cold windows
- This seminar: continuity + high levels

www.BuildingScience.com

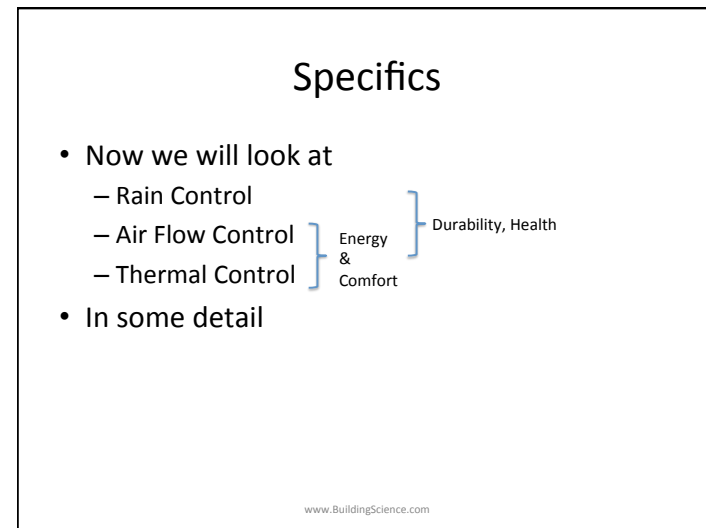

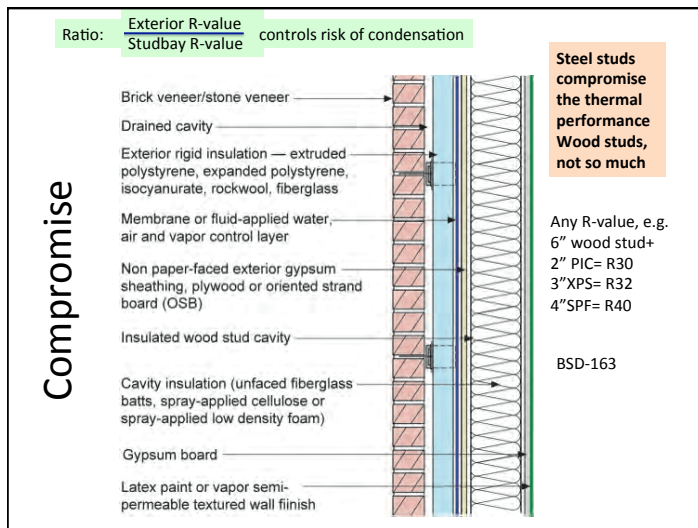

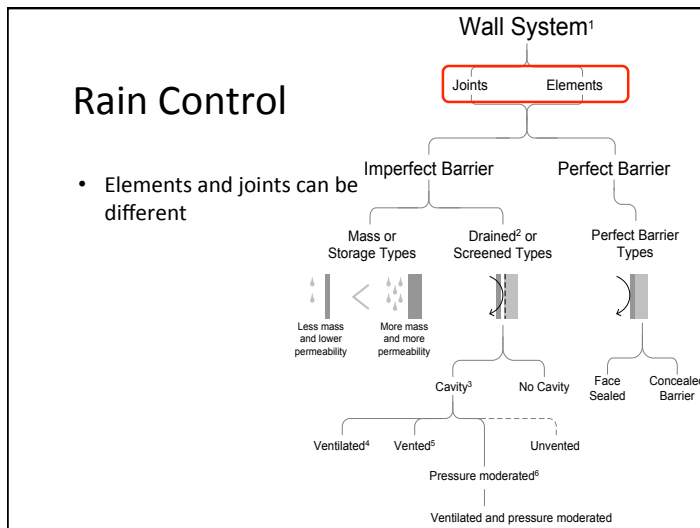

Rain Control

- Next to structure, the most important, fundamental requirement
- Source of many serious building problems
- Major impact on durability
- Low-energy buildings & rain
 - Different enclosure assemblies
 - Reduced drying ability

www.BuildingScience.com

No building paper, flashing, weepholes

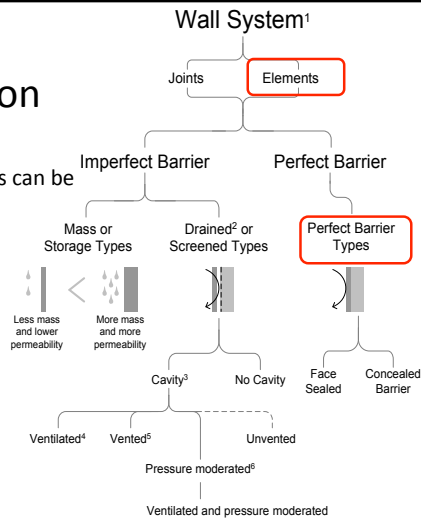

Surface features such as Overhangs, Drips, etc are important for mass walls

Categorization

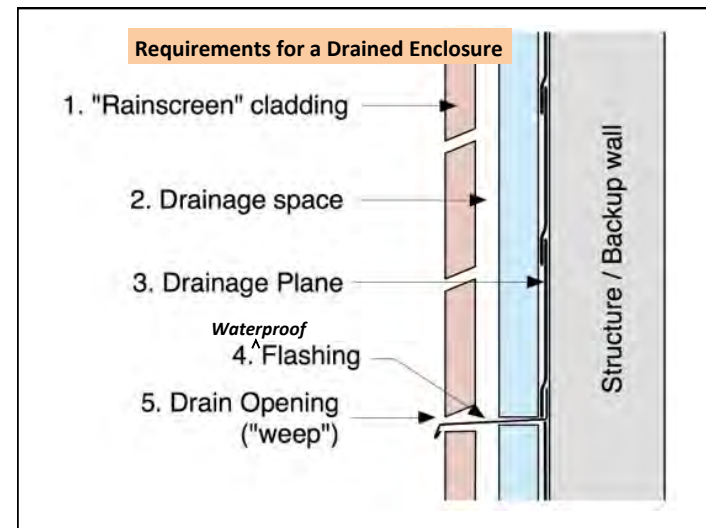

- Elements and joints can be different

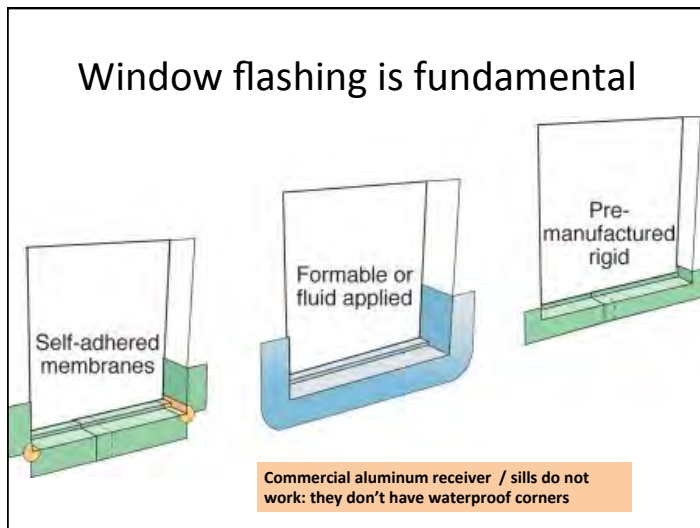

Perfect Barrier / Face Sealed

www.BuildingScience.com

Air-Water-Vapor Membranes

- Often thin layers, membrane or fluid-applied
- *Can be*
 1. Water control (vapor permeable, not airtight), **or**
 2. Air & water control (vapor permeable), **or**
 3. Air, water & vapor (vapor impermeable).
- Examples
 - Building paper, untaped housewrap, sealed and supported housewrap, fluid applied, peel and stick

www.BuildingScience.com

Details

- Air & water & vapor transition membranes

www.BuildingScience.com Airflow Control No. 75/79

Mixed membrane + liquid

Often use membranes for transitions

www.BuildingScience.com

Continuity is key!

- Must ensure no rain leaks
- Airflow control should be as continuous as practical
- Thermal control
 - We live with penetrations
 - Minimize steel and concrete to small local
- Vapor control
 - Not that important to ensure continuity

www.BuildingScience.com

Air Barrier Systems

- Need an excellent air barrier in all buildings
 - Comfort & health
 - Moisture / condensation
 - Energy
 - Sound, fire, etc.
- Cant make it too tight.
- Multiple air barriers improve redundancy

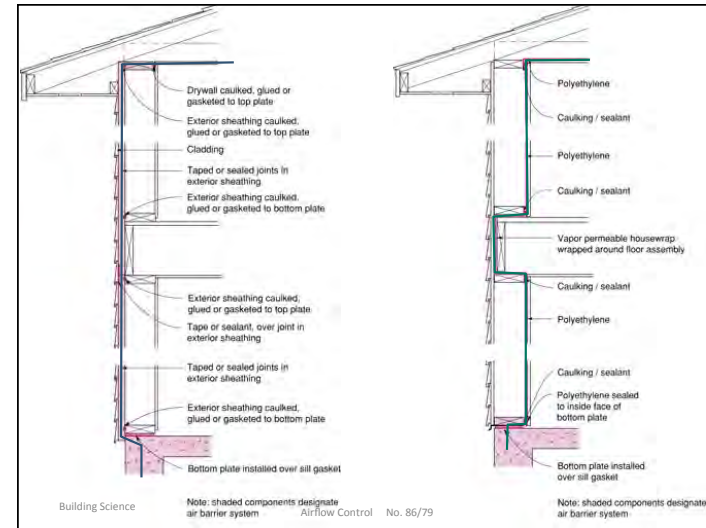

www.BuildingScience.com

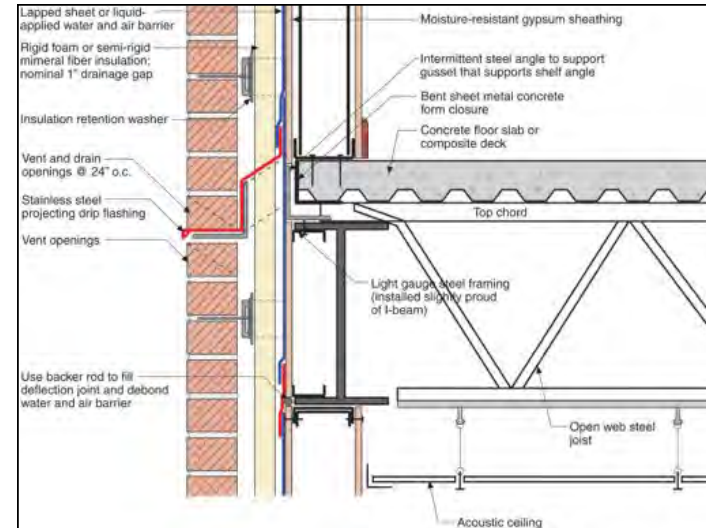

Air Barriers Requirements

- Requirements
 - **Continuous (most important)**
 - **Strong**
 - **Stiff,**
 - **Durable,**
 - **Air Impermeable (least important)**
- Easily 1/3 of total heat loss is due to air leakage in well-insulated building

85/175

12-06-18

Thermal Control

www.buildingscience.com

Thermal Continuity

- Some short circuiting is normally tolerated.
- High-performance walls tolerate few
- Major offenders / weak spots
 - Penetrating slabs (<R1)
 - Steel studs (<R1)
 - Windows (R2-R3)
- Area and low R matter to overall significance

www.BuildingScience.com

Best-case R-values for stud walls

Thermal Bridge Examples

- Balconies, etc
- Exposed slab edges

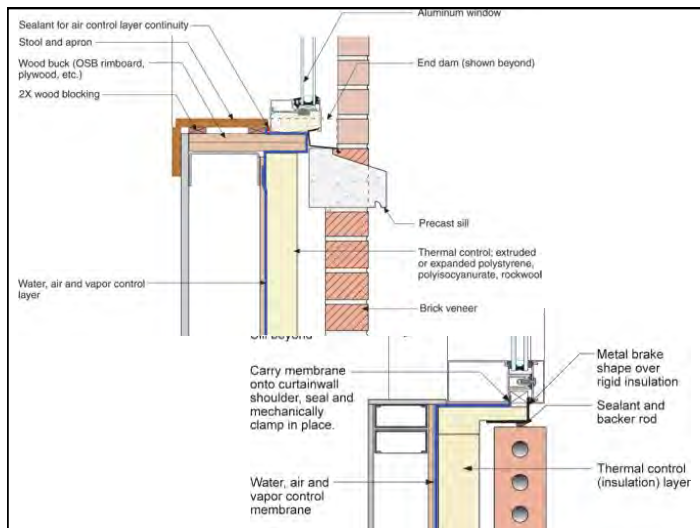

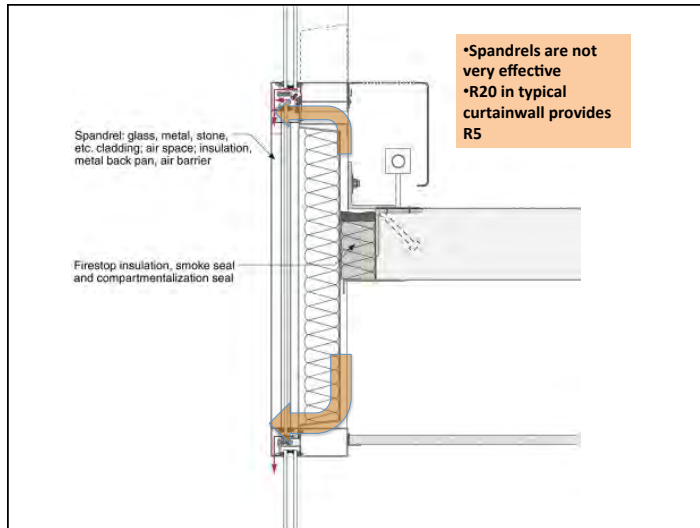

Windows

- Our most expensive thermal bridges
- Aluminum is 4-5 times as conductive as steel
- Difficult to buy commercial aluminum windows / curtainwall over R3.
- Allow solar heat in
 - Useful in cold weather
 - Requires cooling in summer

Windows and Curtainwalls No. 10880

	Center of Glass (COG) Performance*				AlpenGlass™	
	U-Value	R-Value	SHGC	VT	Glazing	Fill
Industry Leading Performance	0.05	20.00	0.29	0.44	Dual Pane, Triple Low Solar Heat Coefficient Film	Xenon
Premium Performance	0.07	14.29	0.24	0.43	Dual Pane, Dual Low Solar Heat Coefficient Film	Krypton
	0.11	9.09	0.51	0.65	Dual Pane, Dual High Solar Heat Coefficient Film	Krypton
High Performance	0.11	9.09	0.30	0.55	Dual Pane, Single Low Solar Heat Coefficient Film	Krypton
	0.19	5.26	0.60	0.73	Dual Pane, Single High Solar Heat Coefficient Film	Krypton

*Performance numbers are center of glass values based on BMF Window E-2 software

Courtesy of ThermaProof Windows and AlpenGlass+

Solar Gain

- Measured by SHGC
- Solar gain useful during cold sunny weather
- But least heating is needed during daytime for commercial buildings
- Overheating discomfort is a real risk
- Must size glass Area x SHGC carefully
 - High values = air conditioning and discomfort

www.BuildingScience.com

Interior or Exterior Shade

- Operable Solar Control of windows may be necessary for ultra-low energy buildings
- Exterior Shades always beat low SHGC glazing
 - But the cost capital and maintenance
- Interior shades don't work well with good windows

Building Science.com

Fully operable shades

Chriesbach Building:
Switzerland

High R wall, 40% glazing (triple)

Enclosure Systems

- rigid insulation — extruded polystyrene, expanded polystyrene, mineral wool, rock wool, fiberglass
- membrane or trowel-on or spray-applied drainage plane, air barrier, vapor retarder
- brick
- channel or wood furring
- gypsum board
- flat or vapor semi-permeable textured wall finish

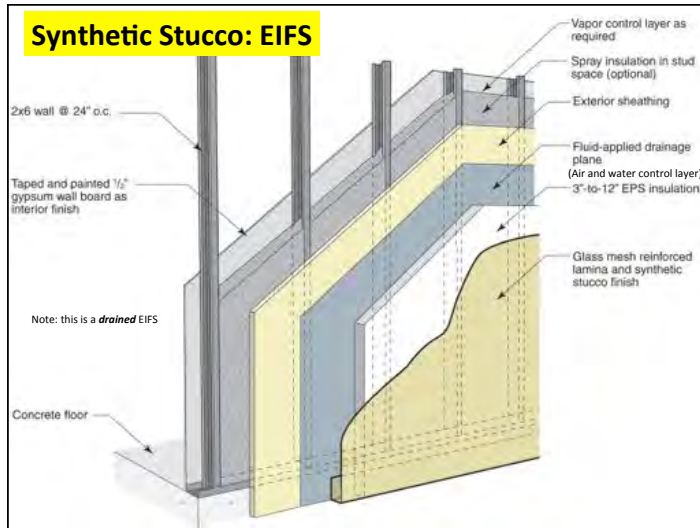

www.buildingscience.com

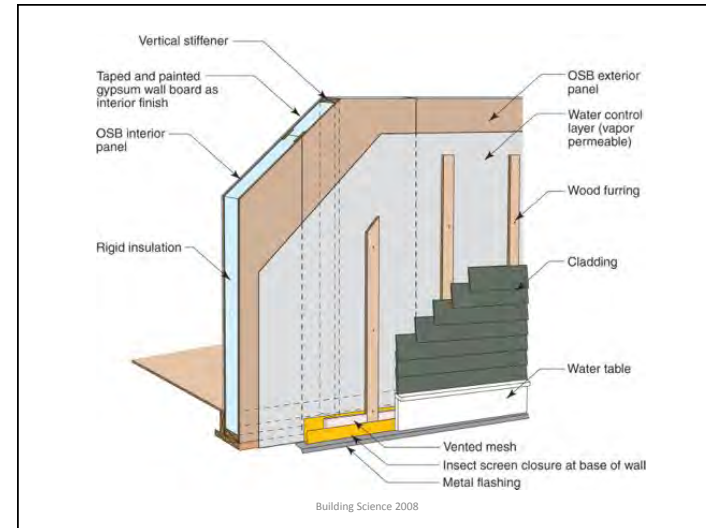

Insulated Concrete Formwork

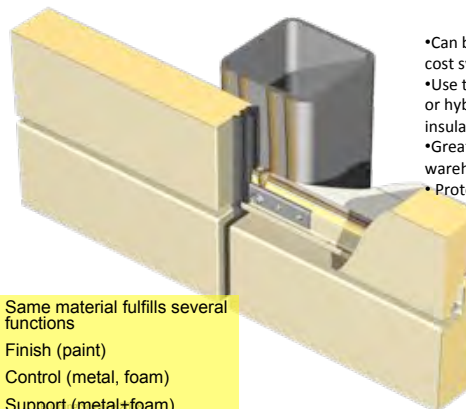

- Excellent thermal control
- Concrete acts as air barrier
- Rain Control! Drain all penetrations
- No vapor barrier needed

Building Science Insulation

Insulated metal panels

- Can be high-performance low-cost system
- Use thicker panels (4-8") and/or hybrid with interior fibrous insulation
- Great for arenas, pools, warehouses, big box stores
- Protect from impact at grade

Same material fulfills several functions
 Finish (paint)
 Control (metal, foam)
 Support (metal+foam)

Summary

- Define the control layers
- Ensure continuity
- Then increase control performance of each

- Window area, performance, and integration into walls becomes critical
