Calculating capillary rise

Capillary rise versus diameter

Surface area vs. particle size
From Straube & Burnett, 2005

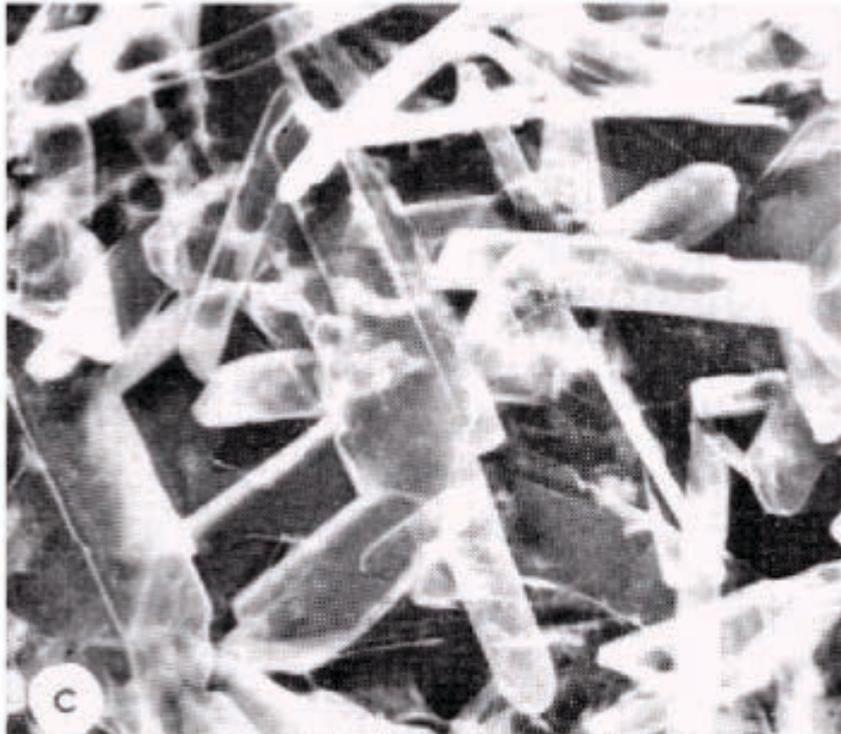

Figure 1c. Gypsum, hydrated from plaster of paris and water, porosity 30 per cent.

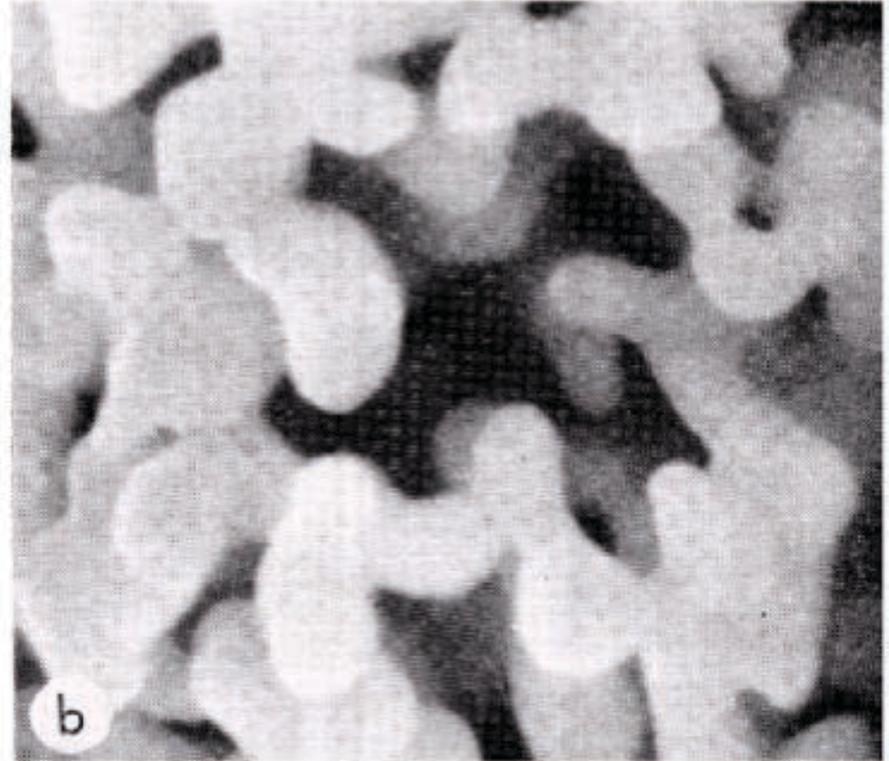

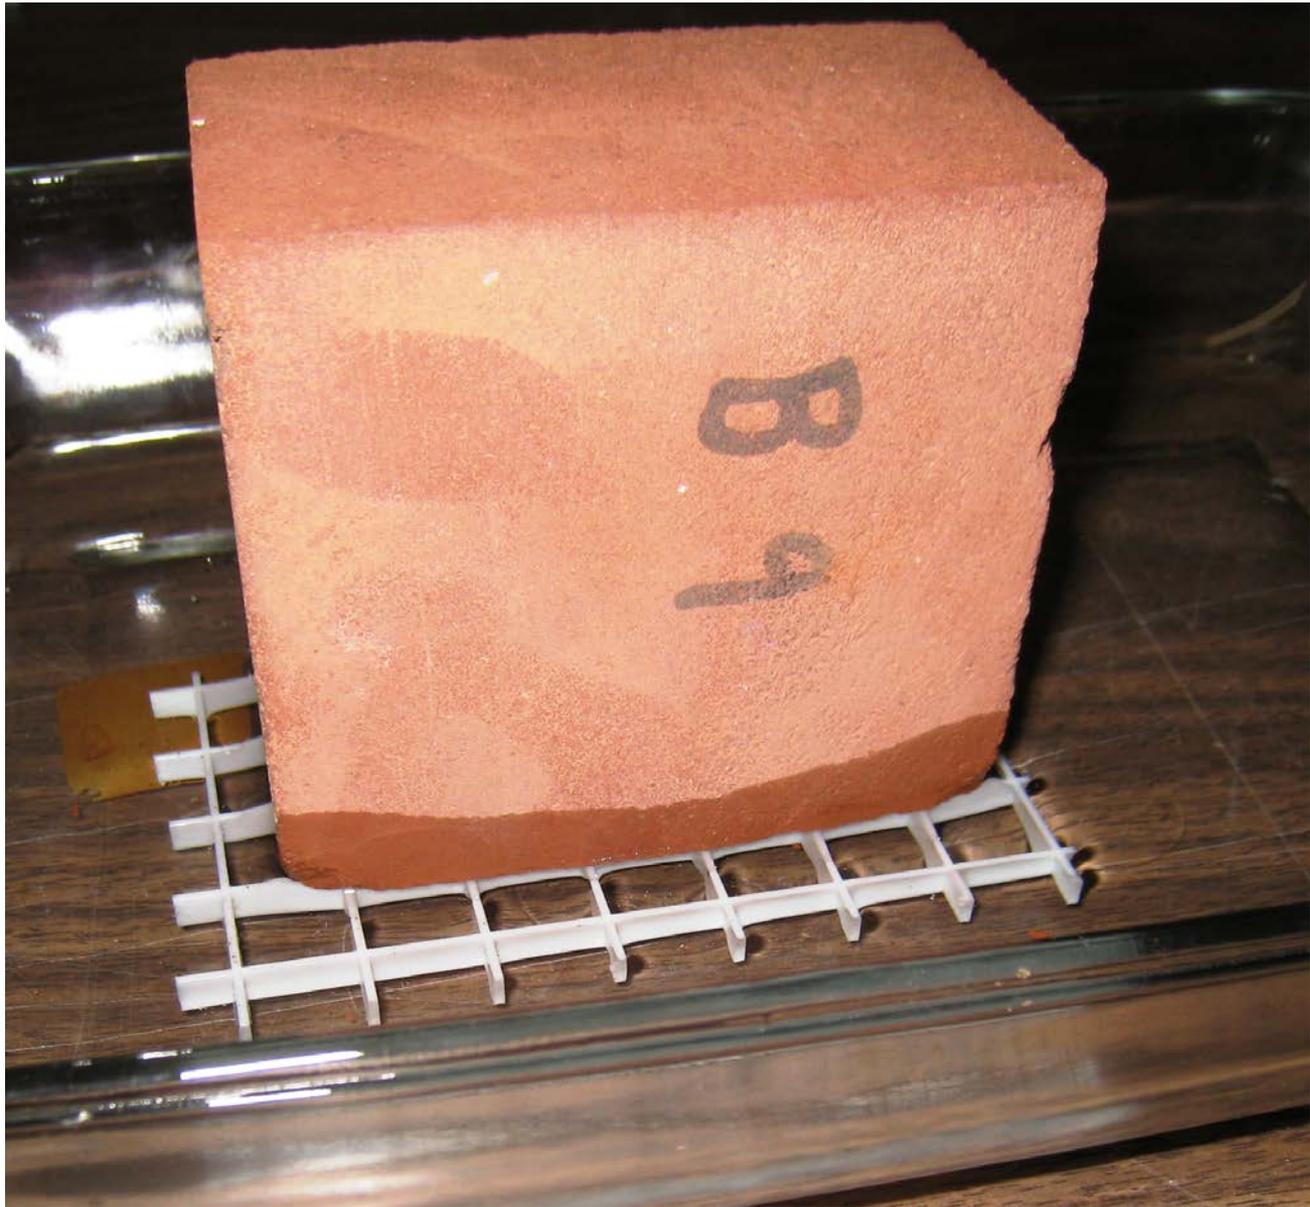

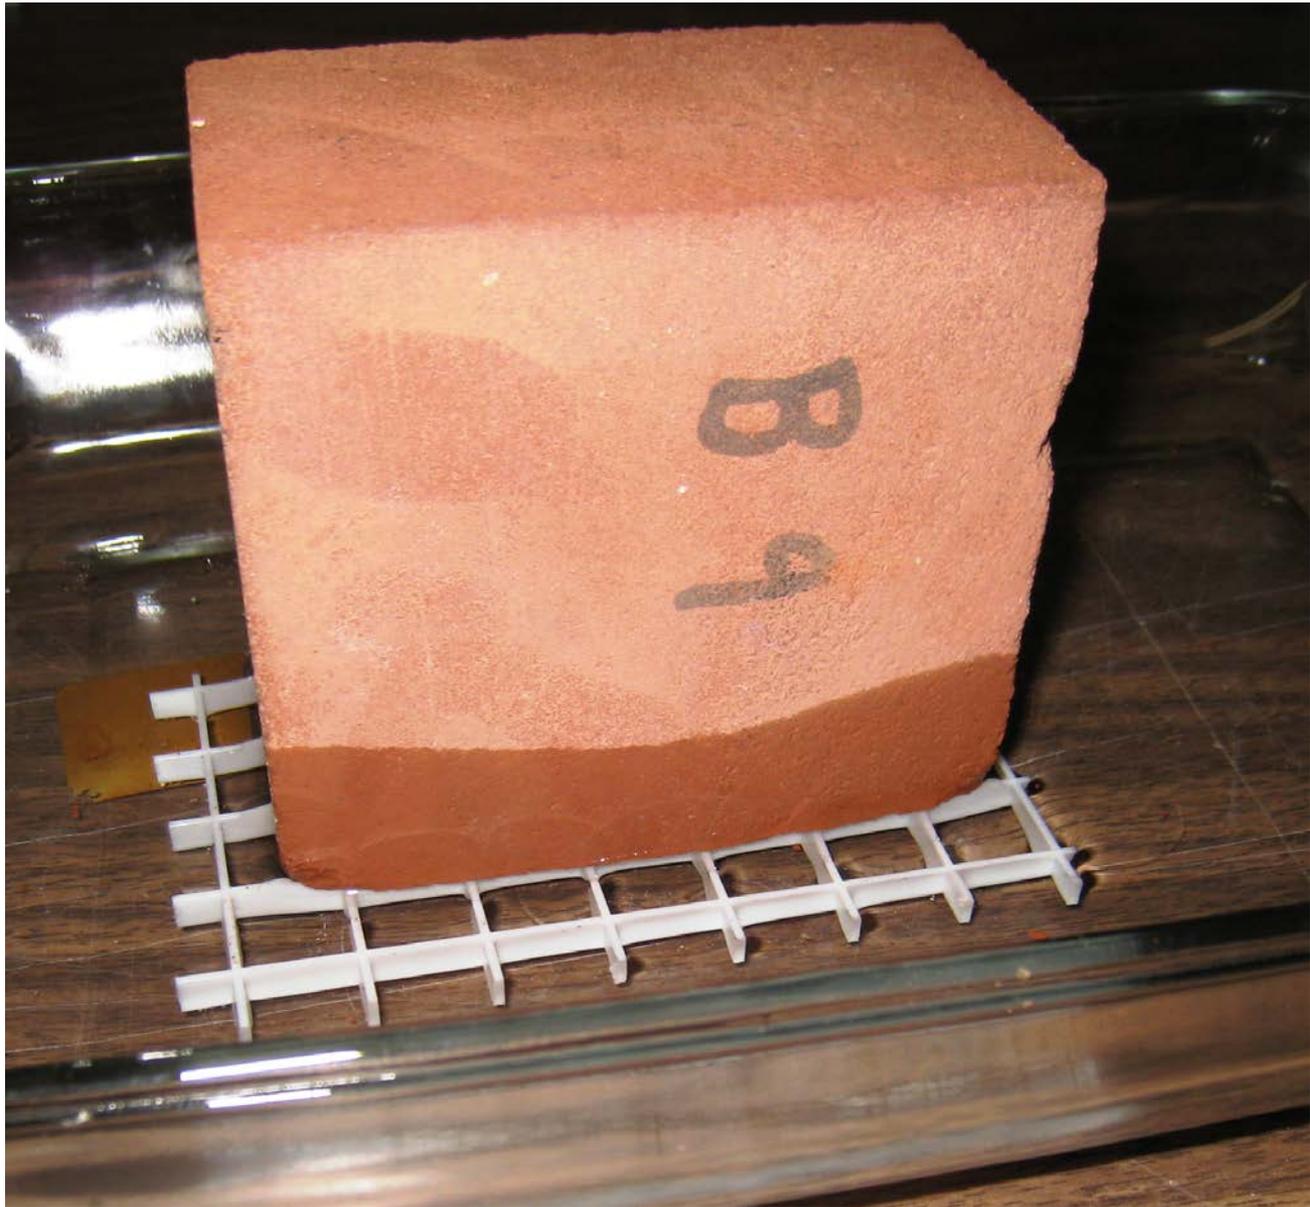

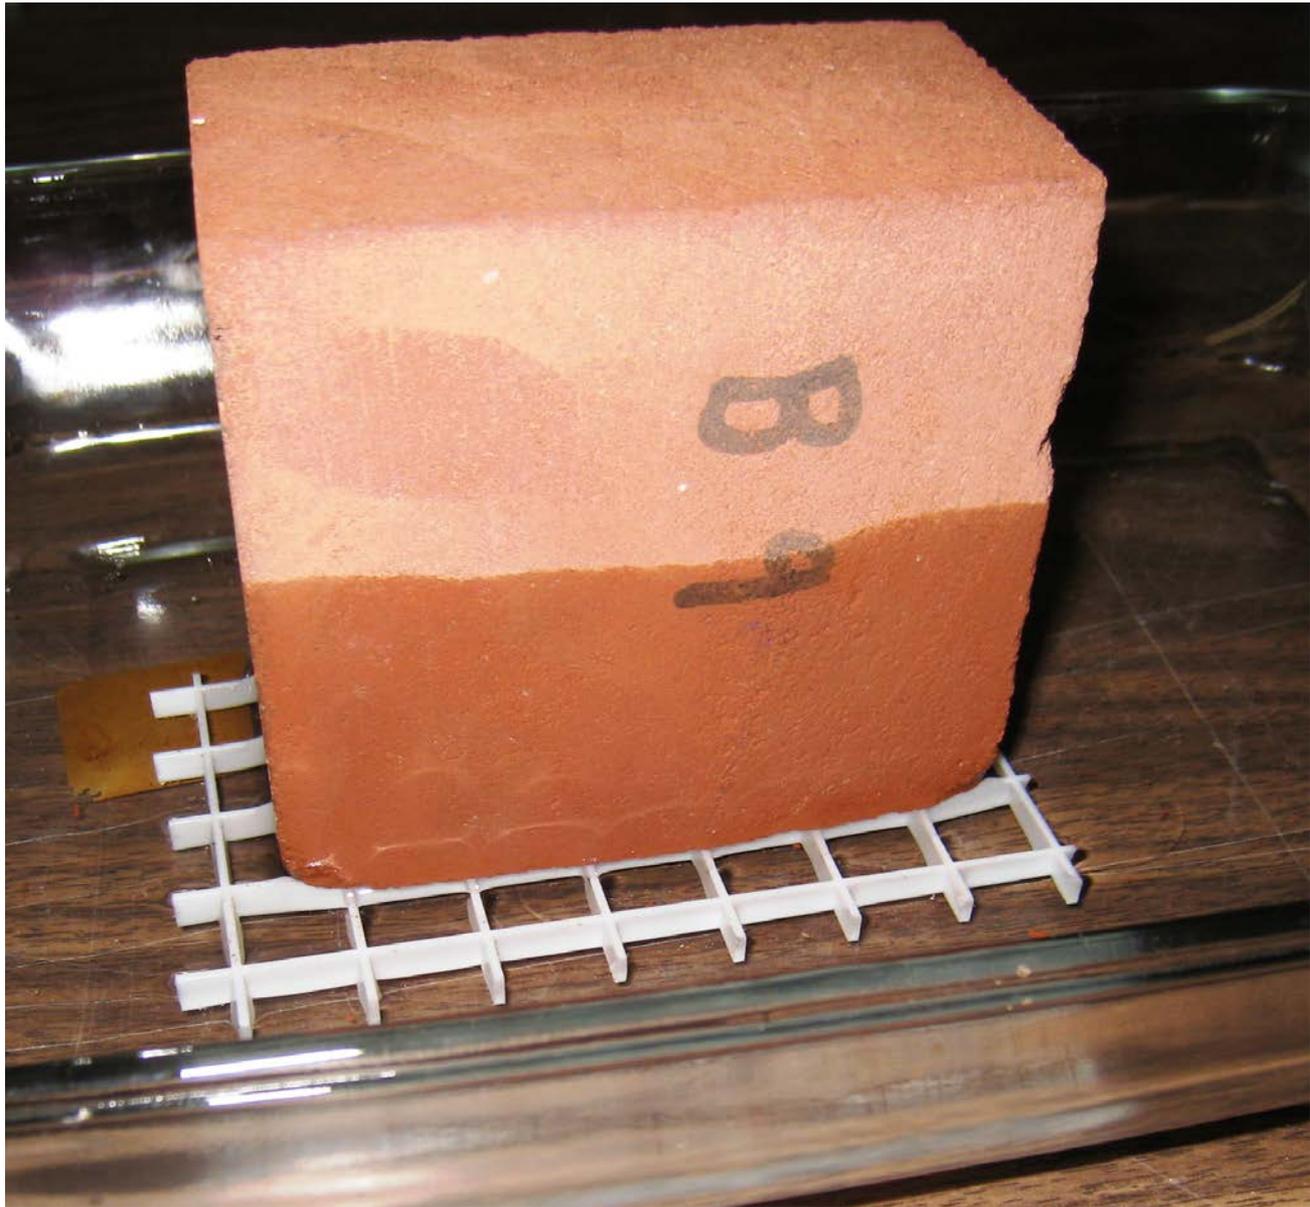

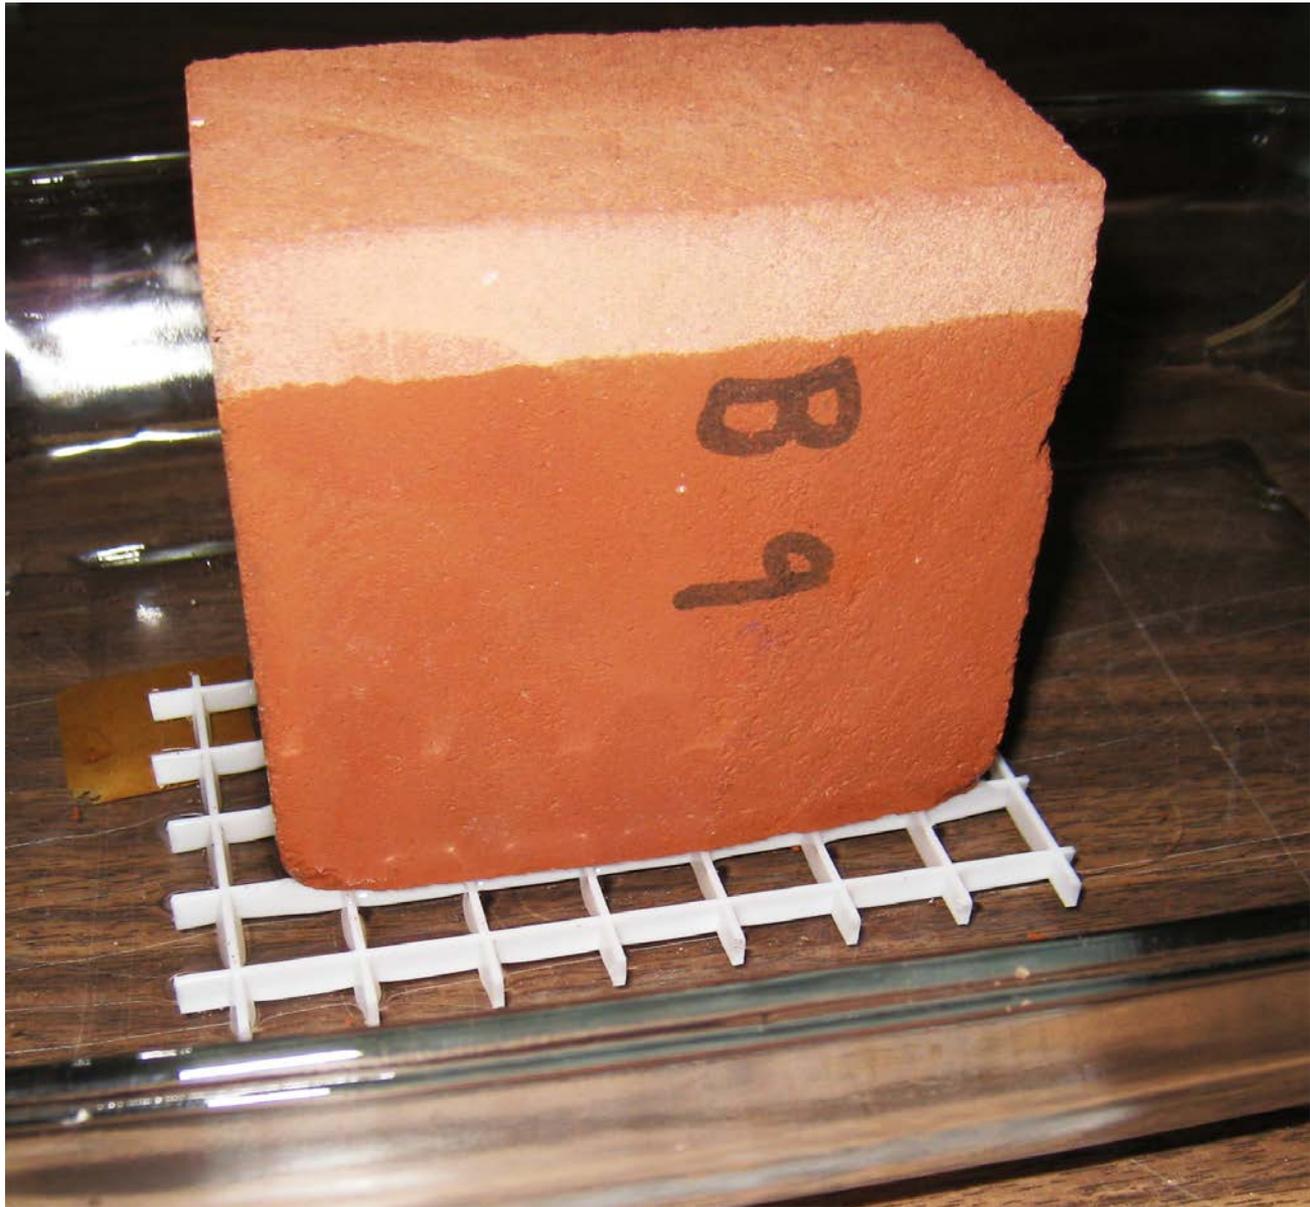

Figure 1b. Brick, sintered clay, porosity 40 per cent.

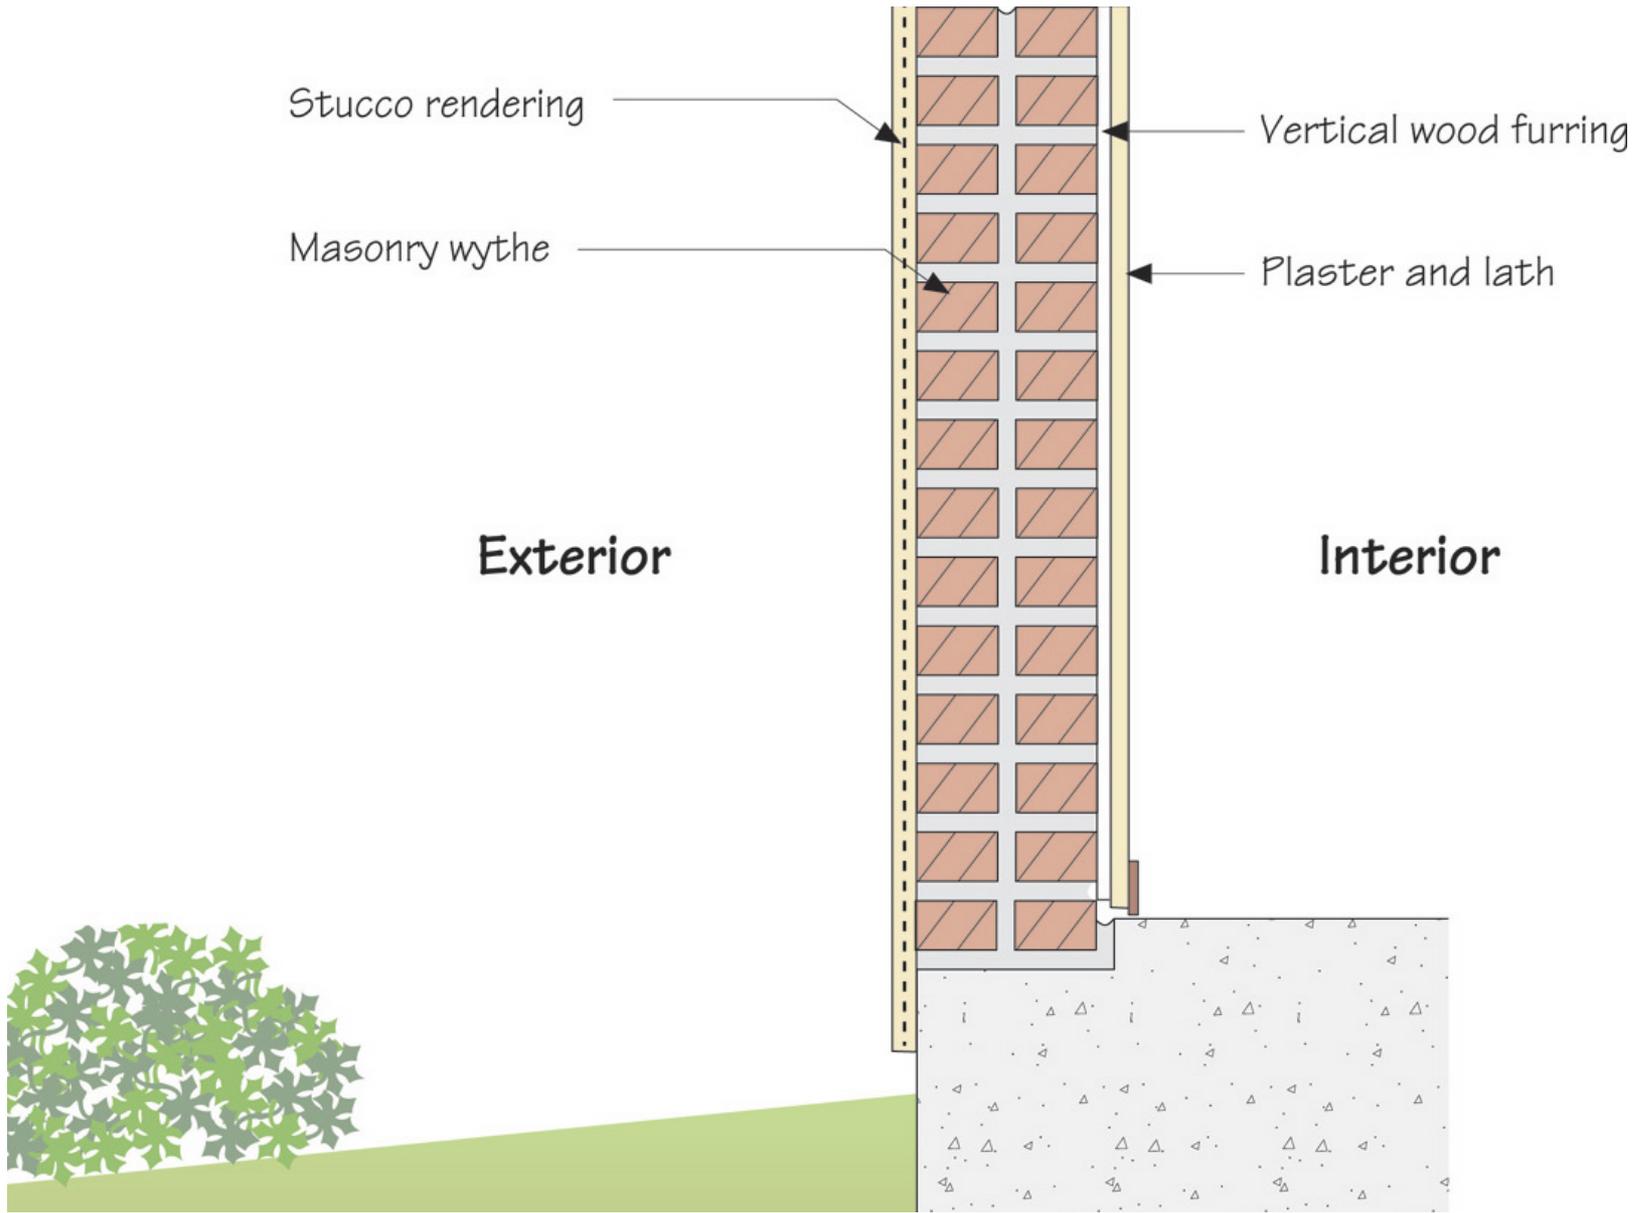

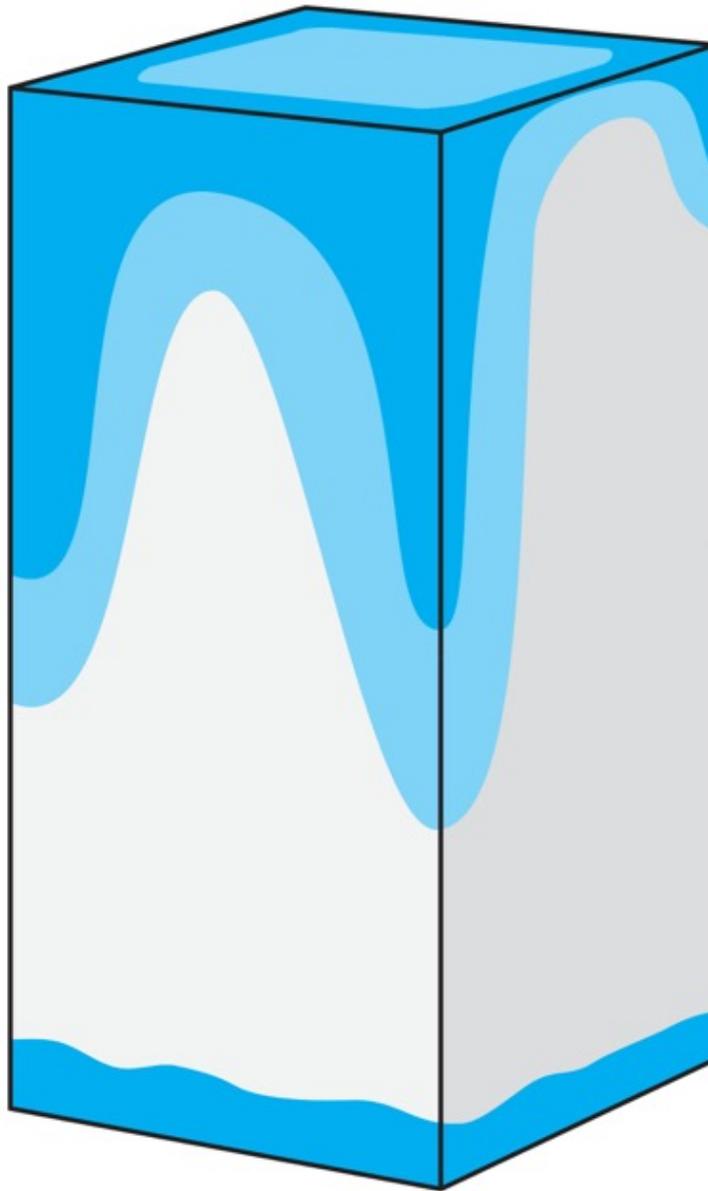

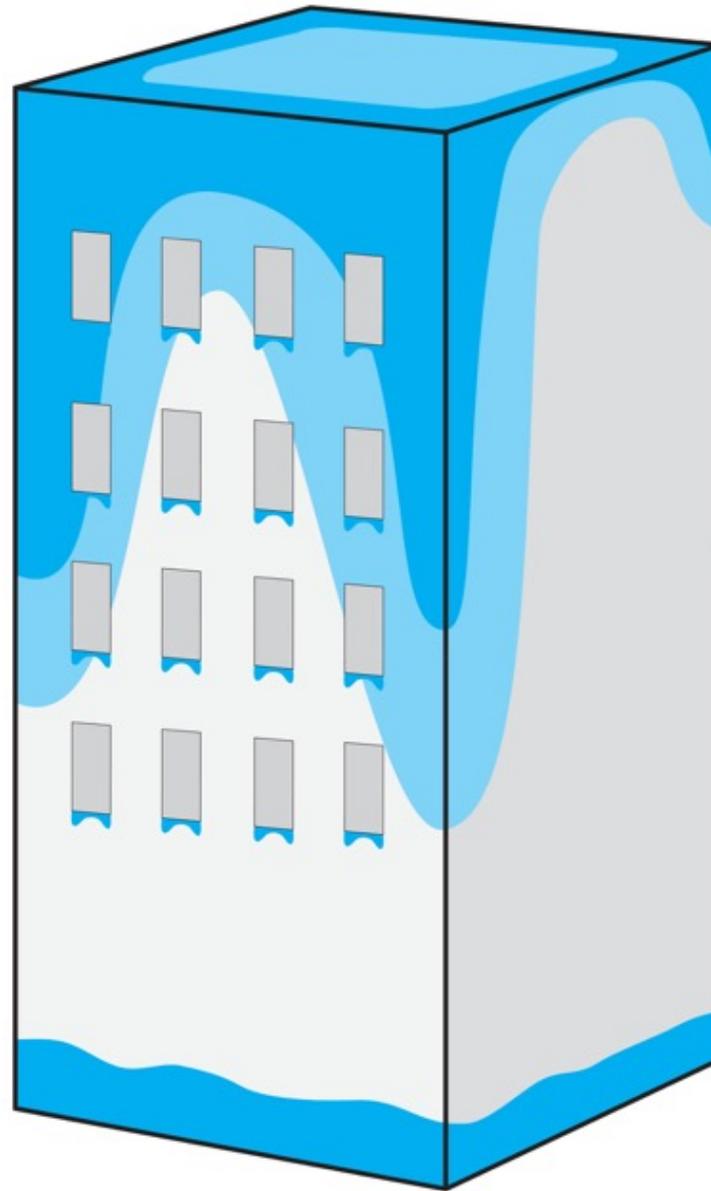

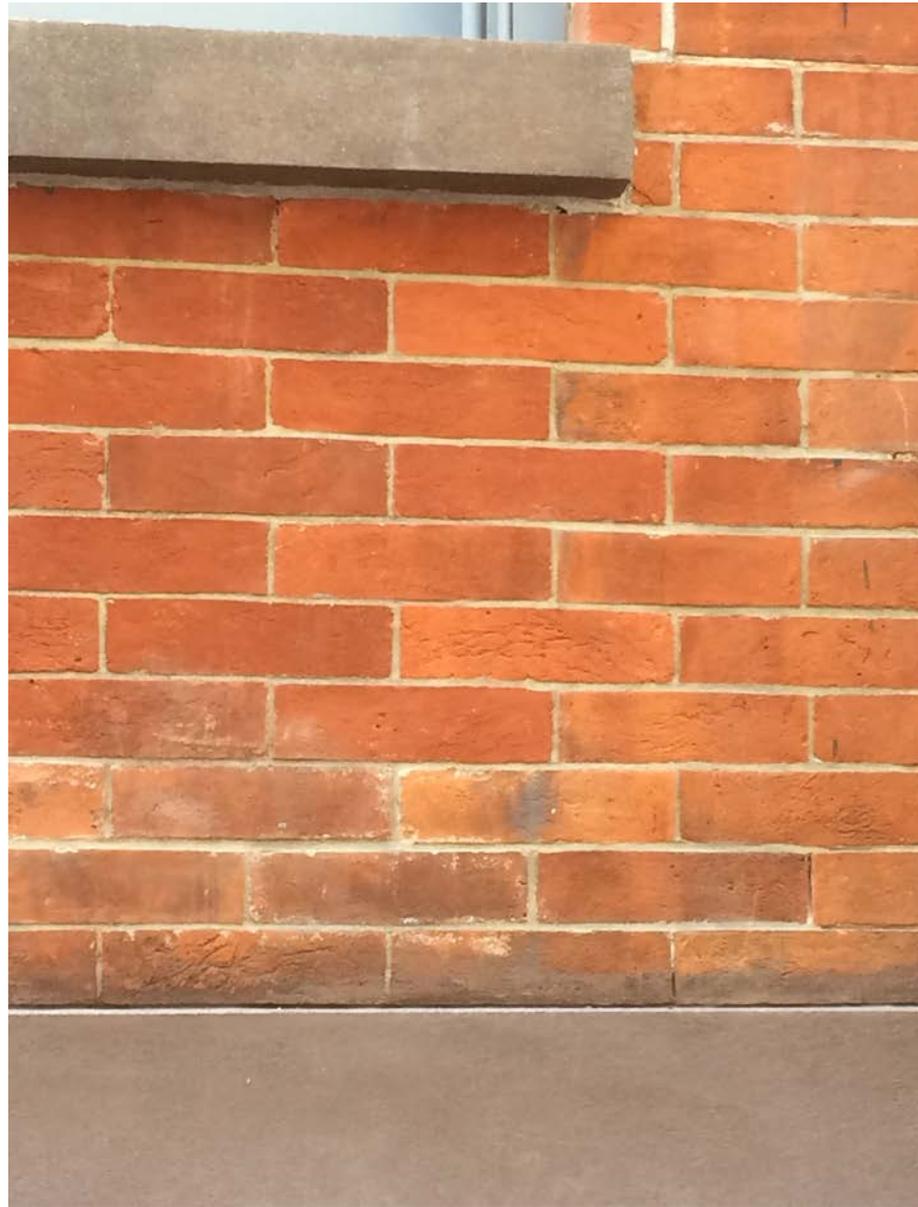

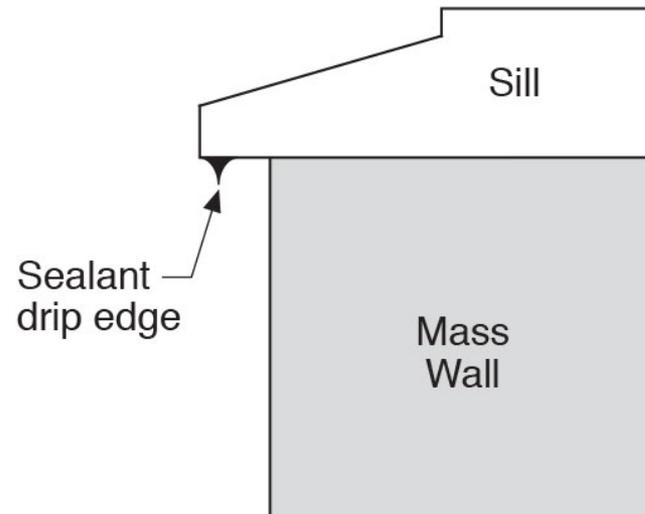

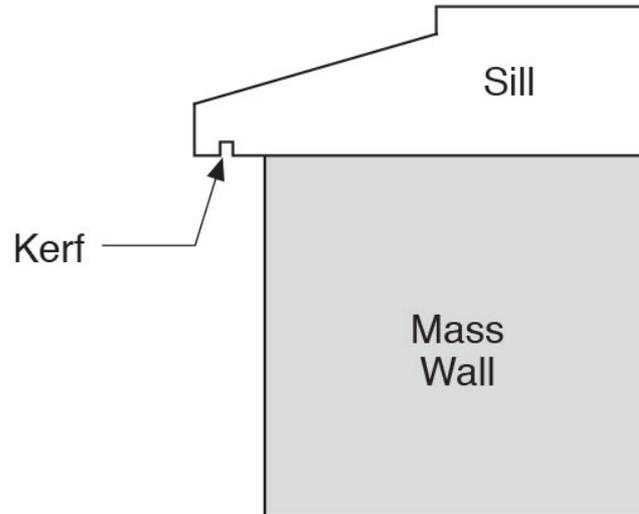

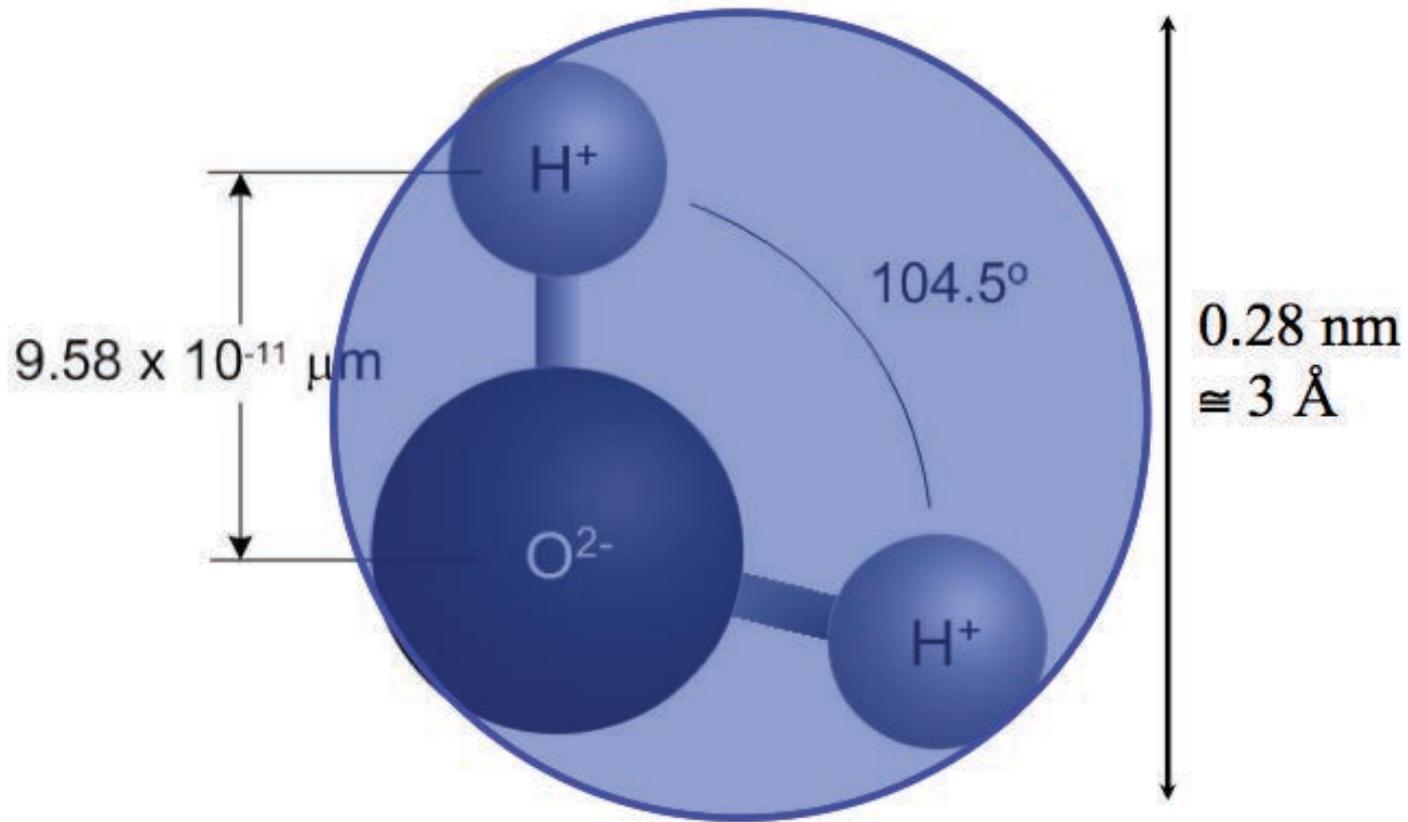

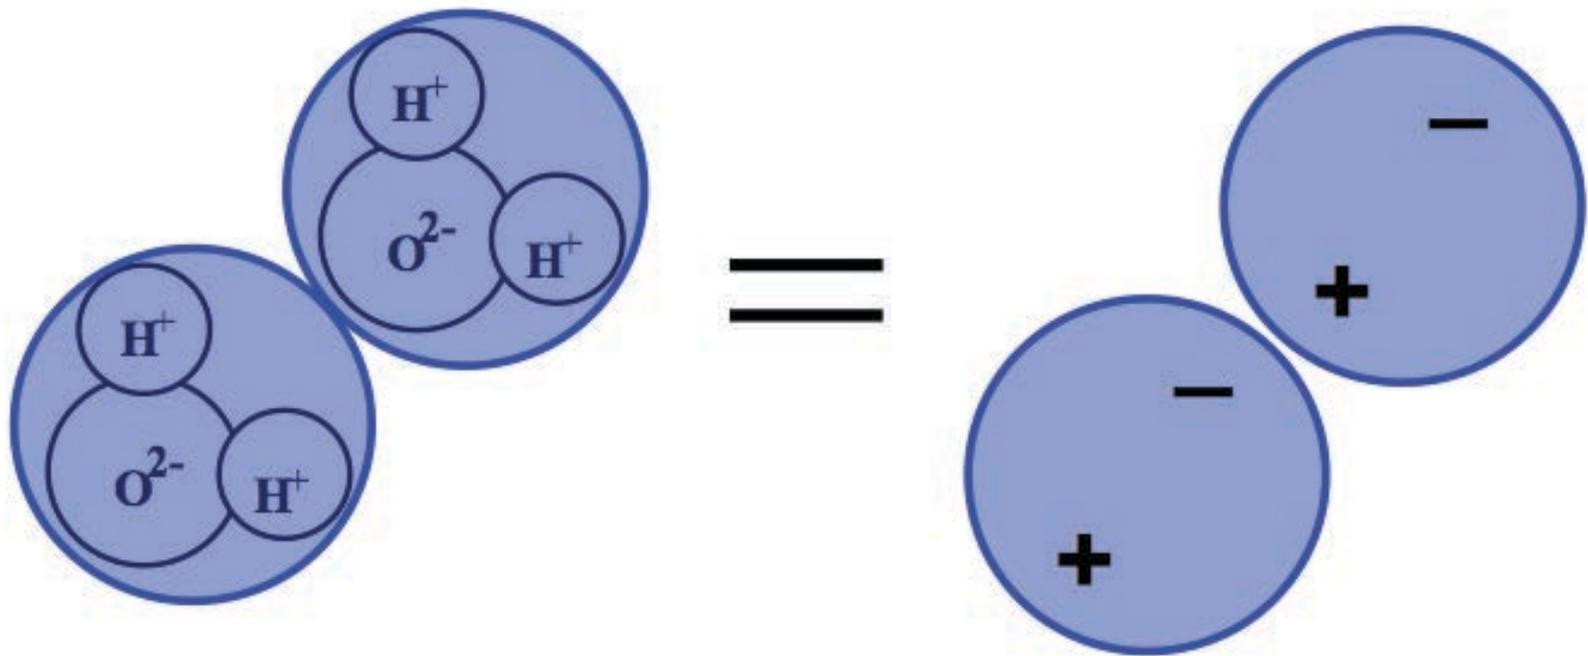

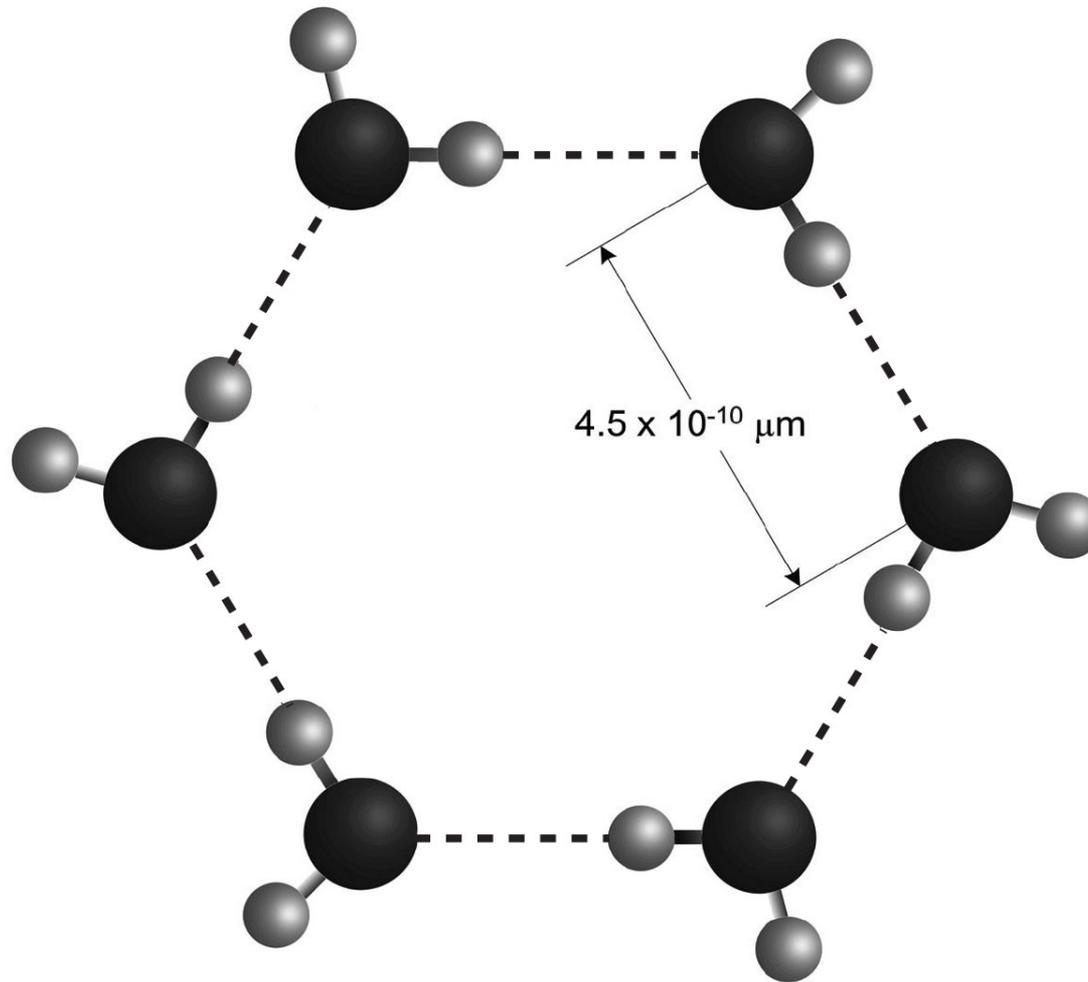

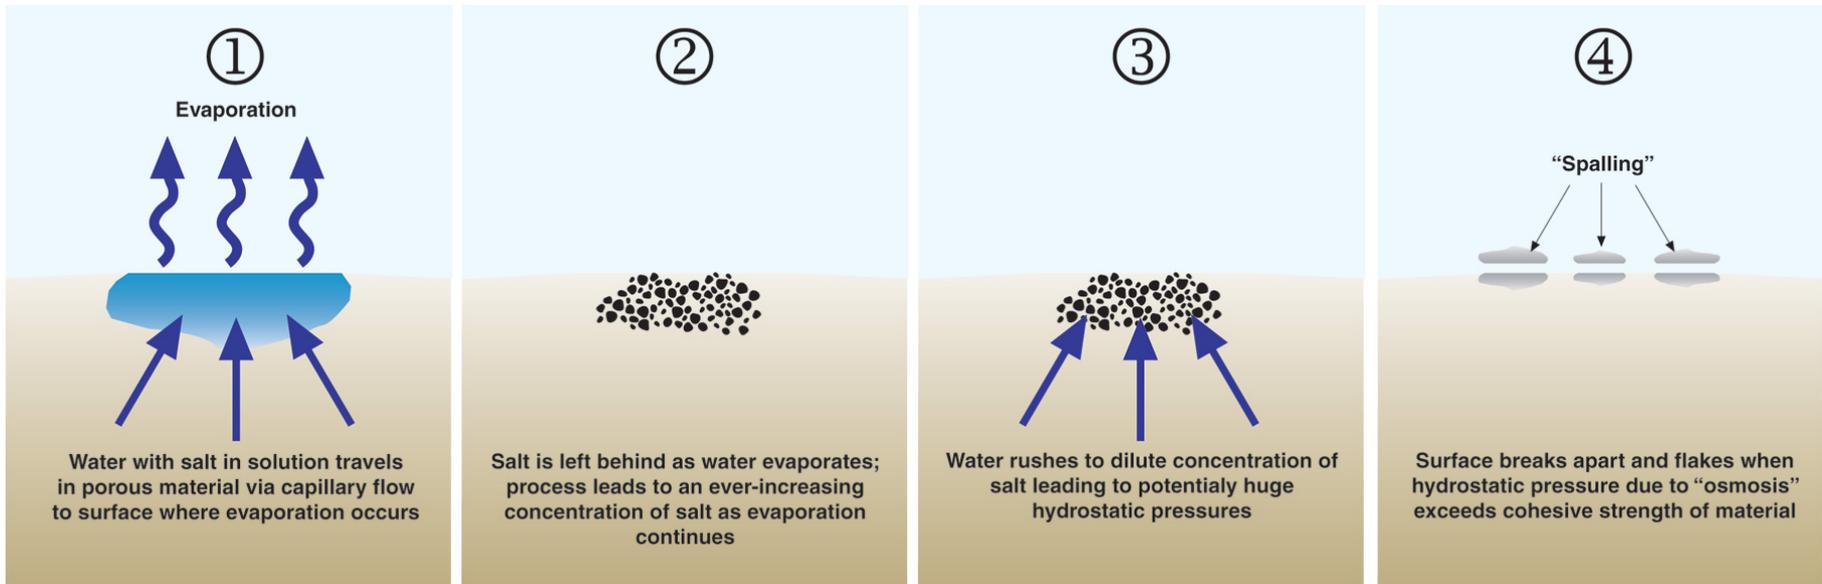

2nd Law of Thermodynamics

Moisture Transport in Porous Media

Phase	Transport Process	Driving Potential
Vapor	Diffusion	Vapor Concentration
Adsorbate	Surface Diffusion	Concentration
Liquid	Capillary Flow	Suction Pressure
	Osmosis	Solute Concentration

Capillarity + Salt = Osmosis

- Mineral salts carried in solution by capillary water
- When water evaporates from a surface the salts left behind form crystals in process called efflorescence
- When water evaporated beneath a surface the salts crystallize within the pore structure of the material in called sub-efflorescence
- The salt crystallization causes expansive forces that can exceed the cohesive strength of the material leading to spalling

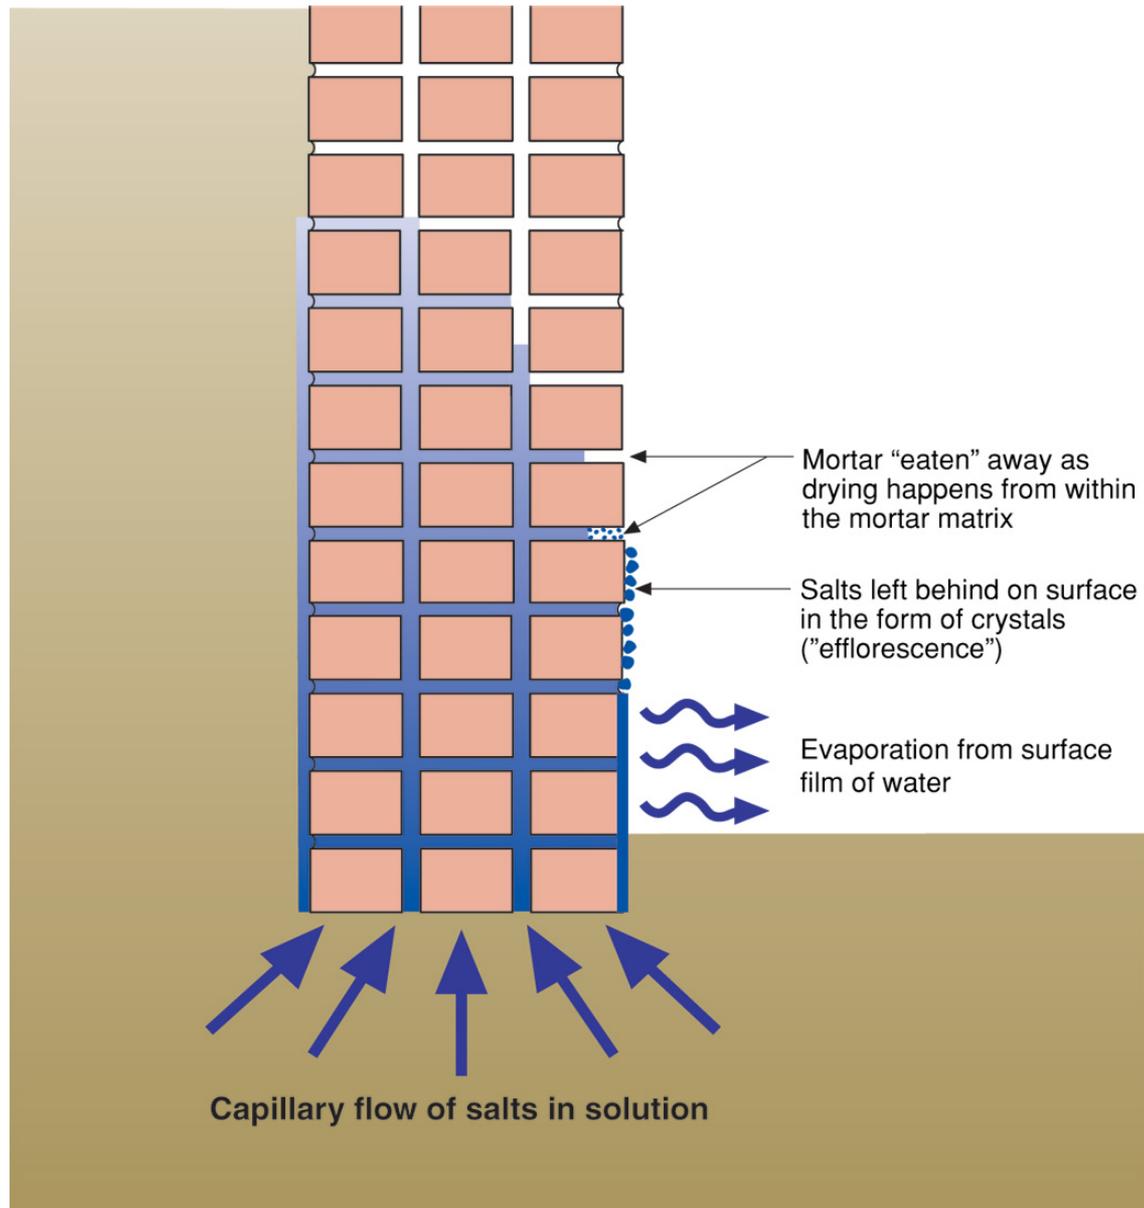

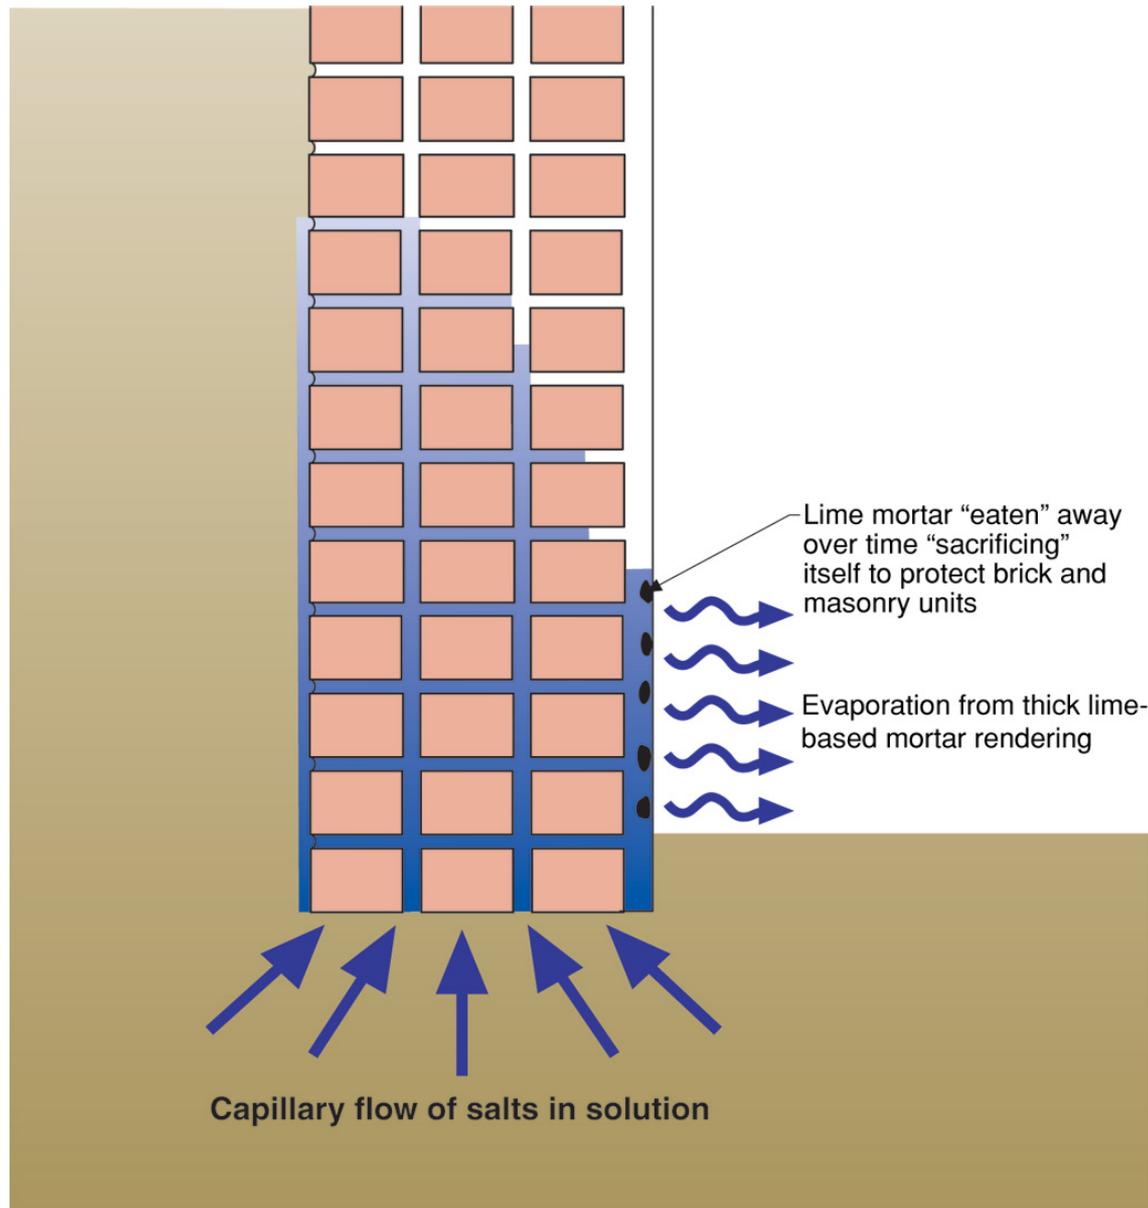

Diffusion + Capillarity + Osmosis = Problem

- Diffusion Vapor Pressure 3 to 5 psi
- Capillary Pressure 300 to 500 psi
- Osmosis Pressure 3,000 to 5,000 psi

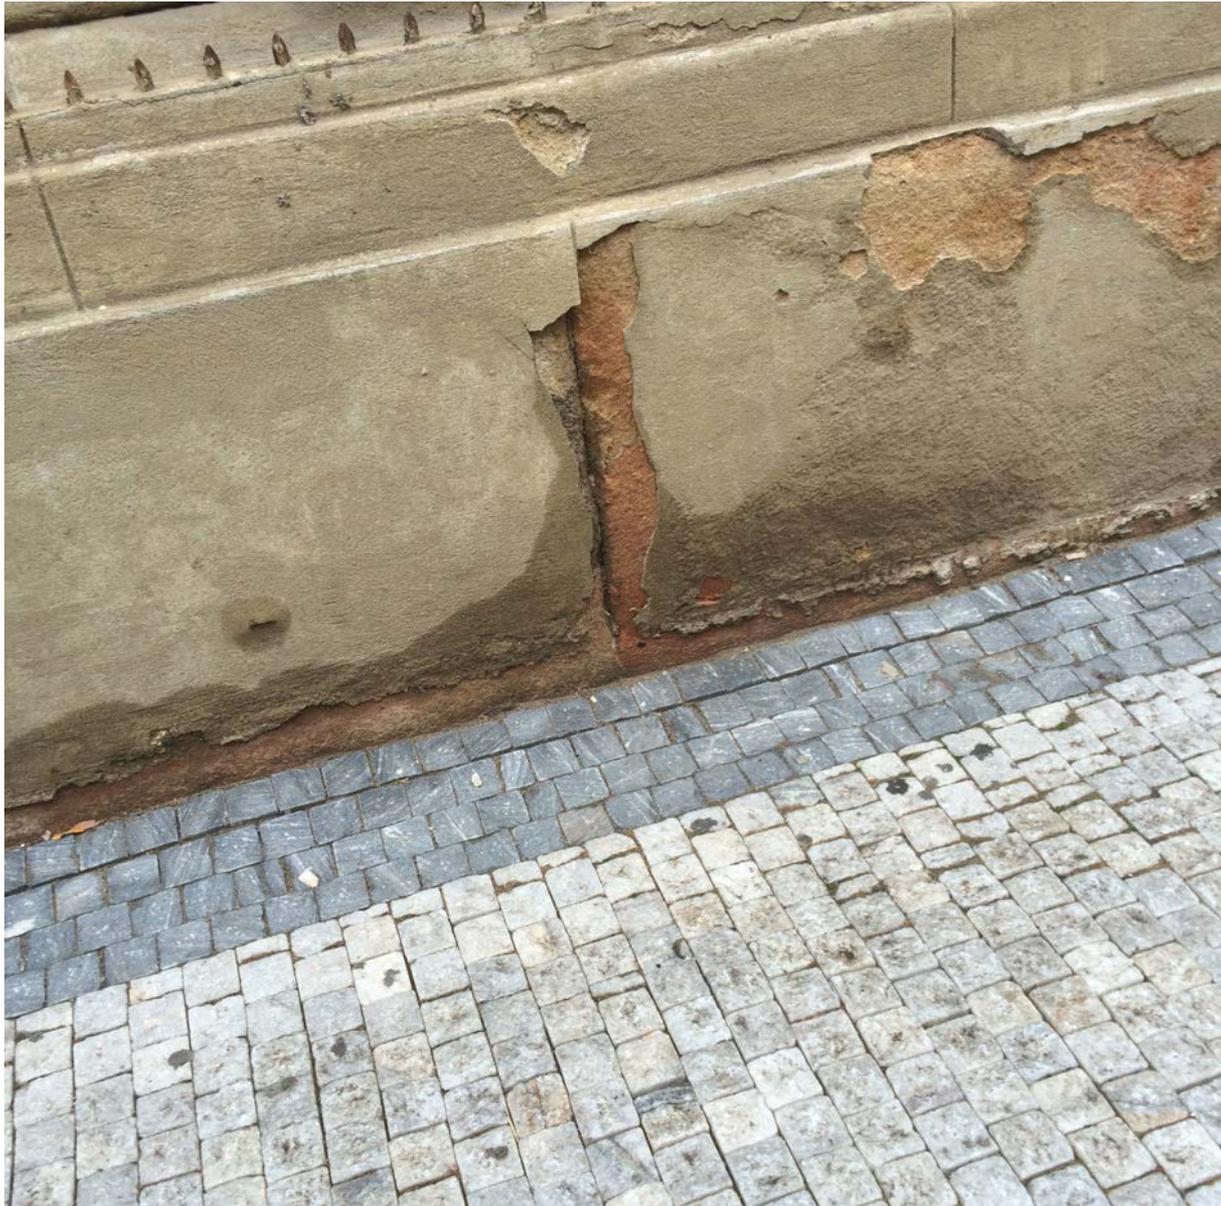

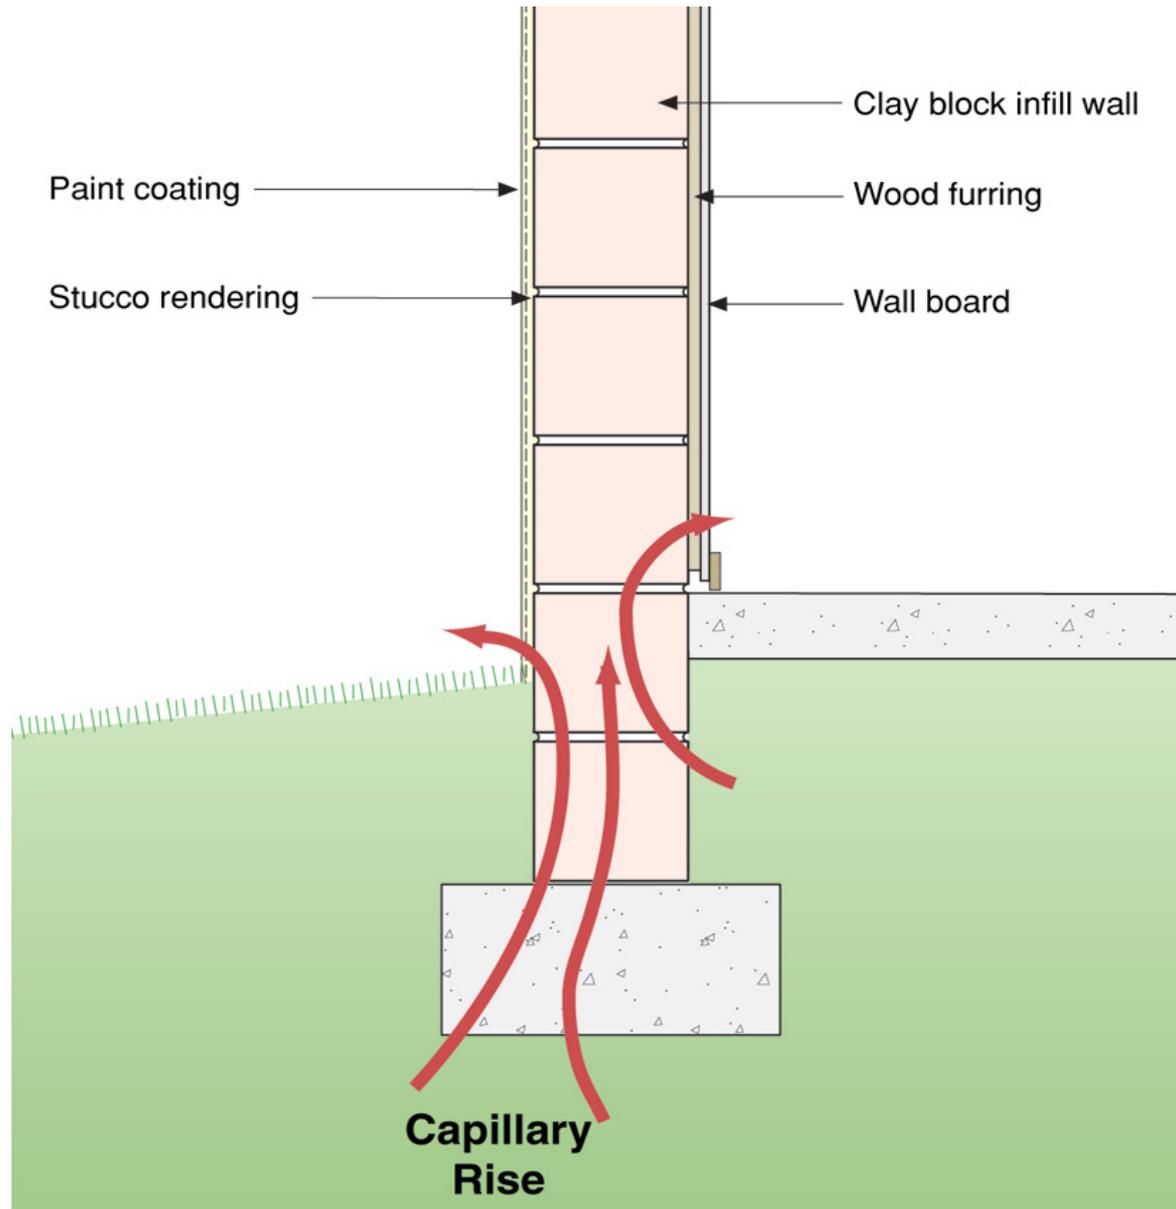

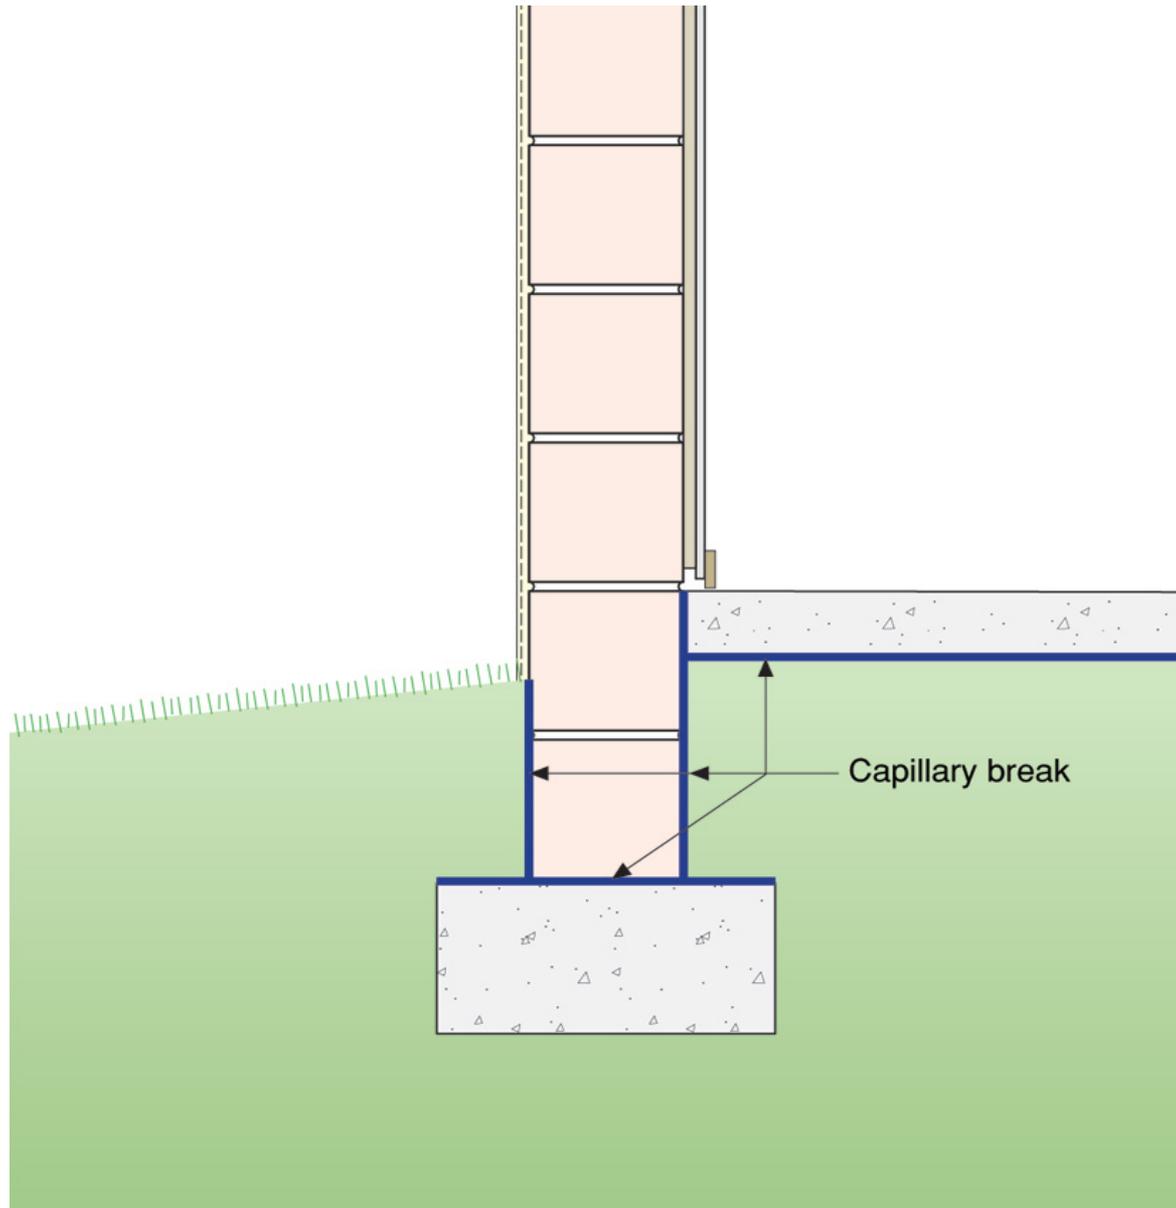

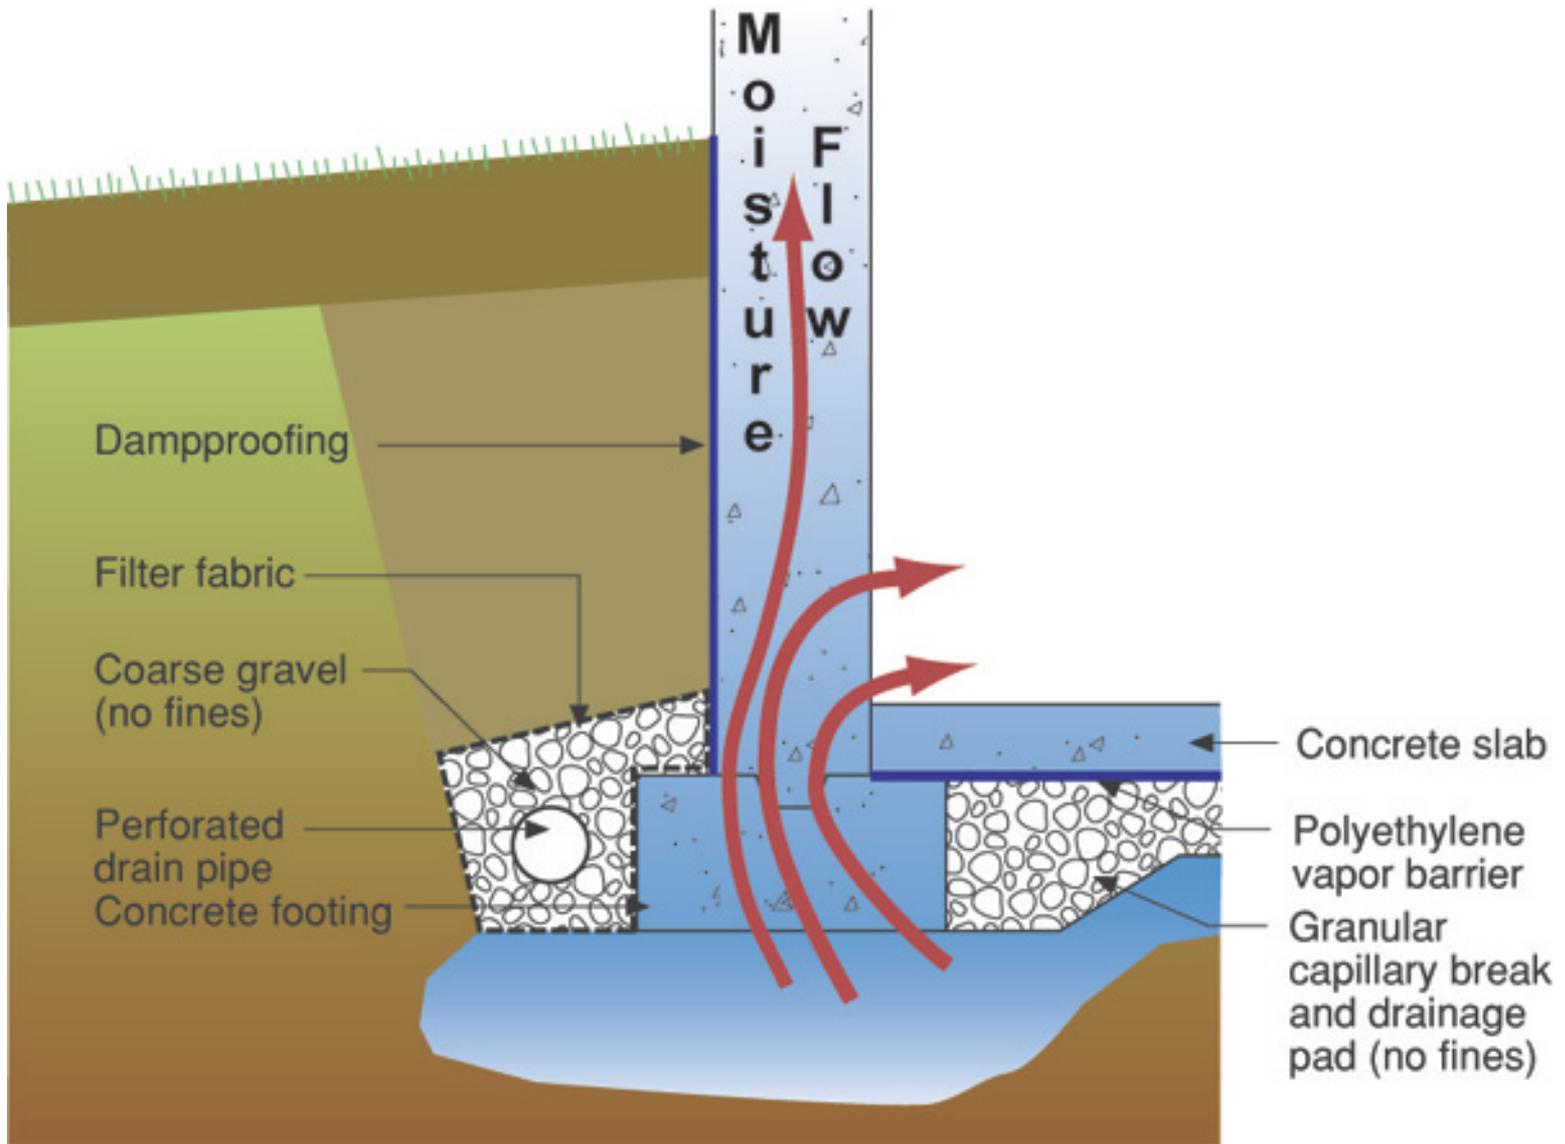

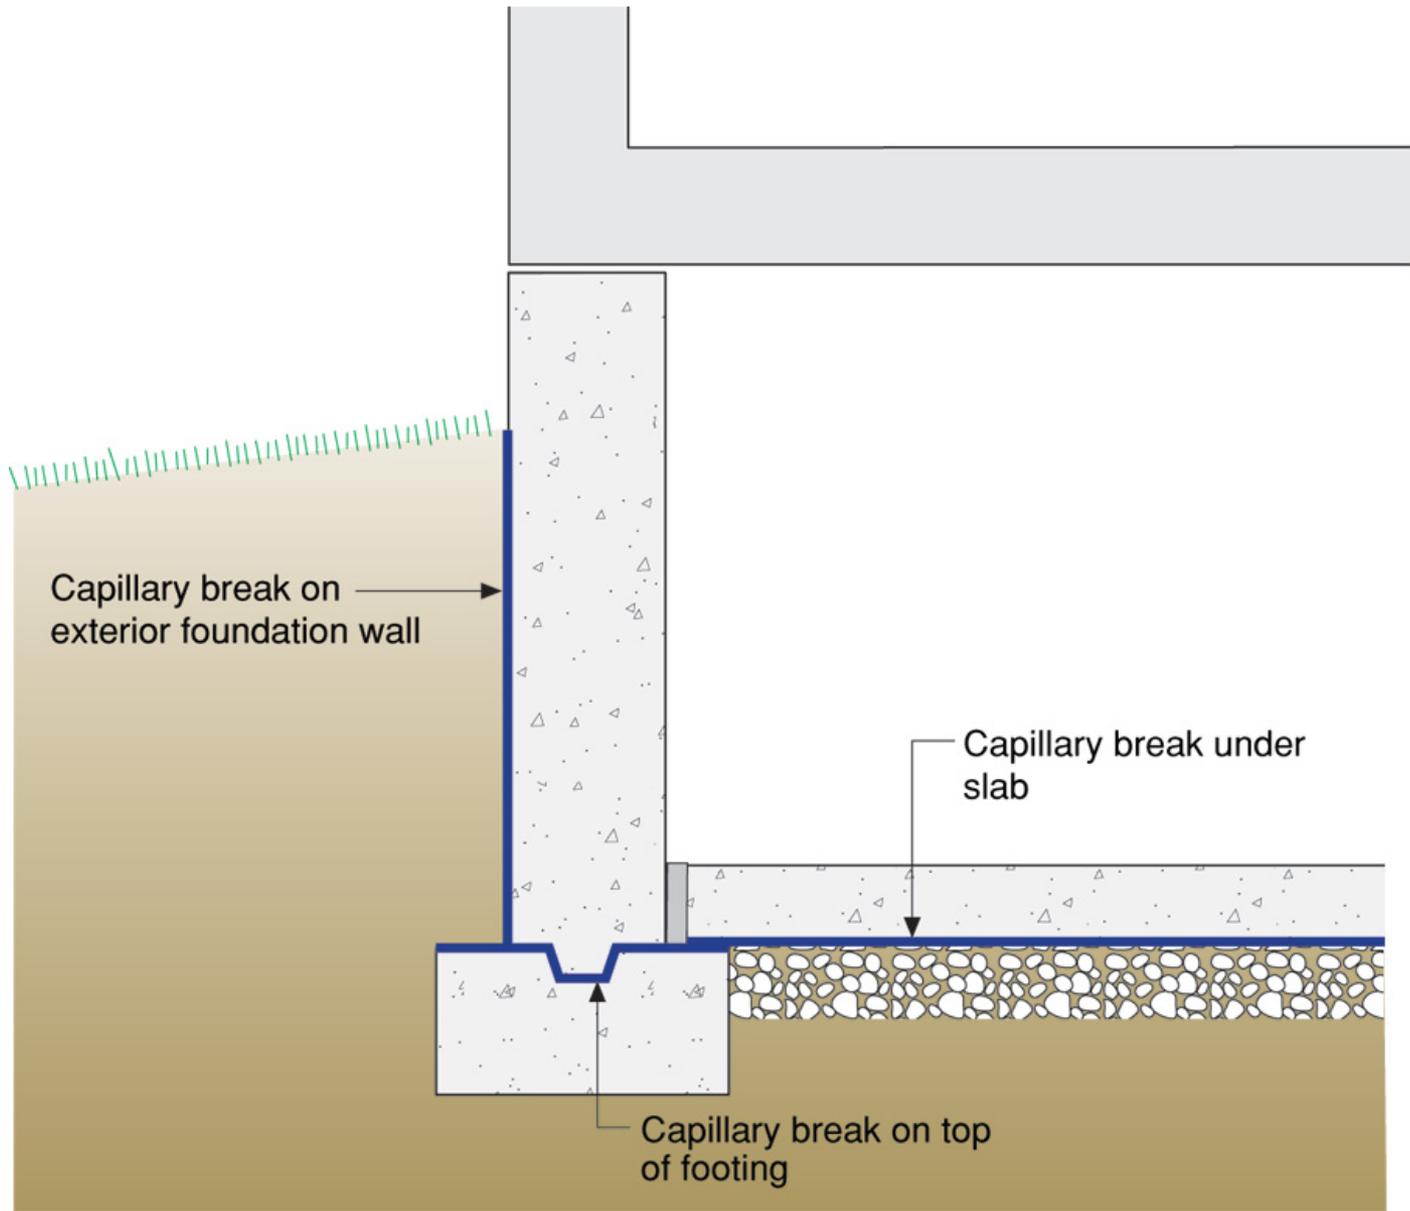

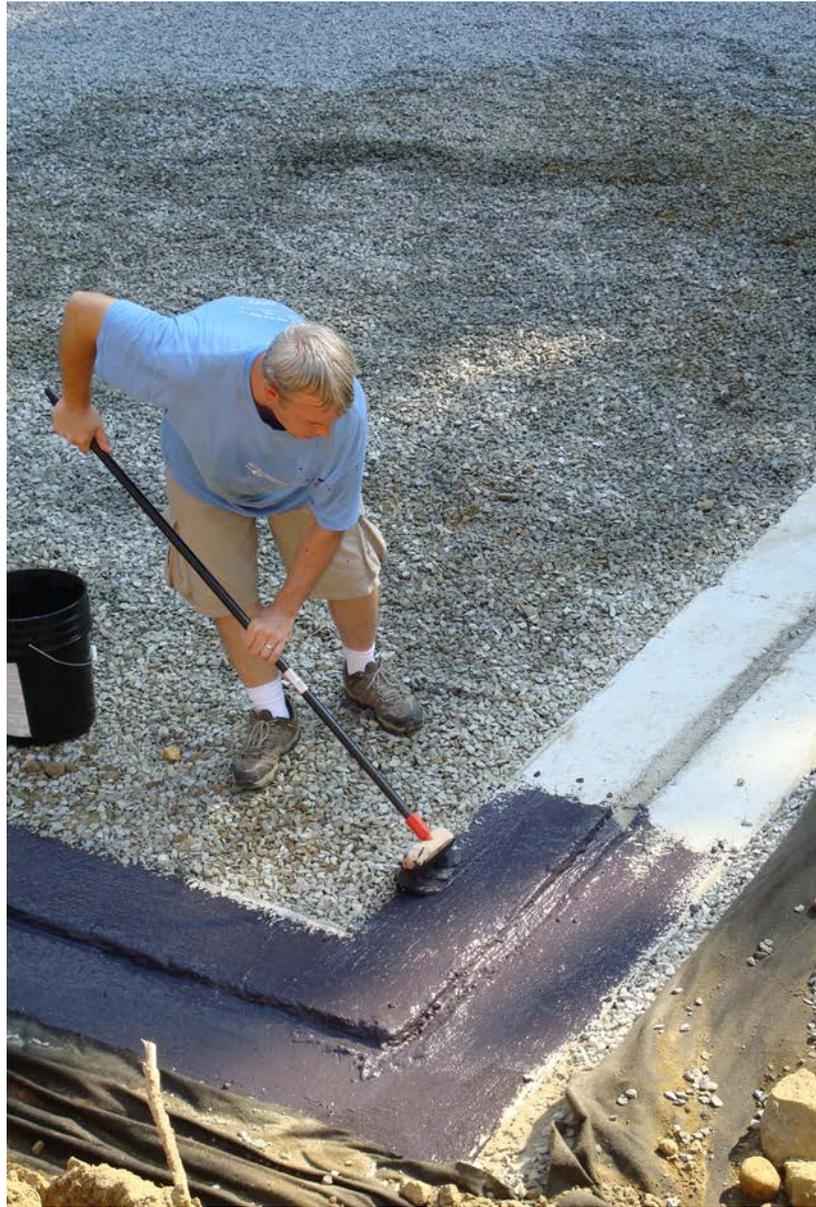

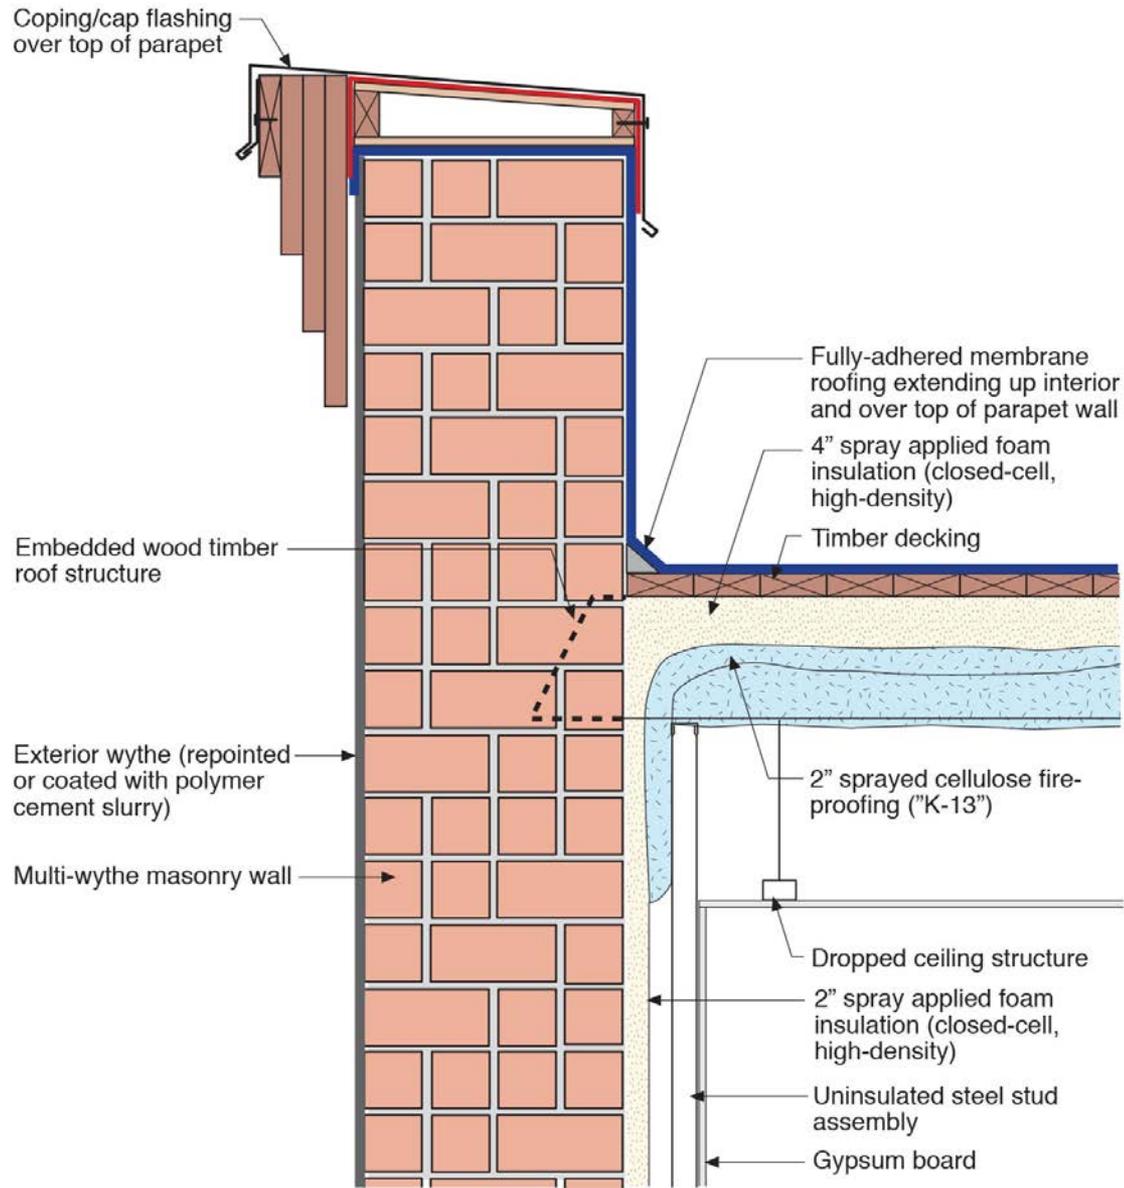

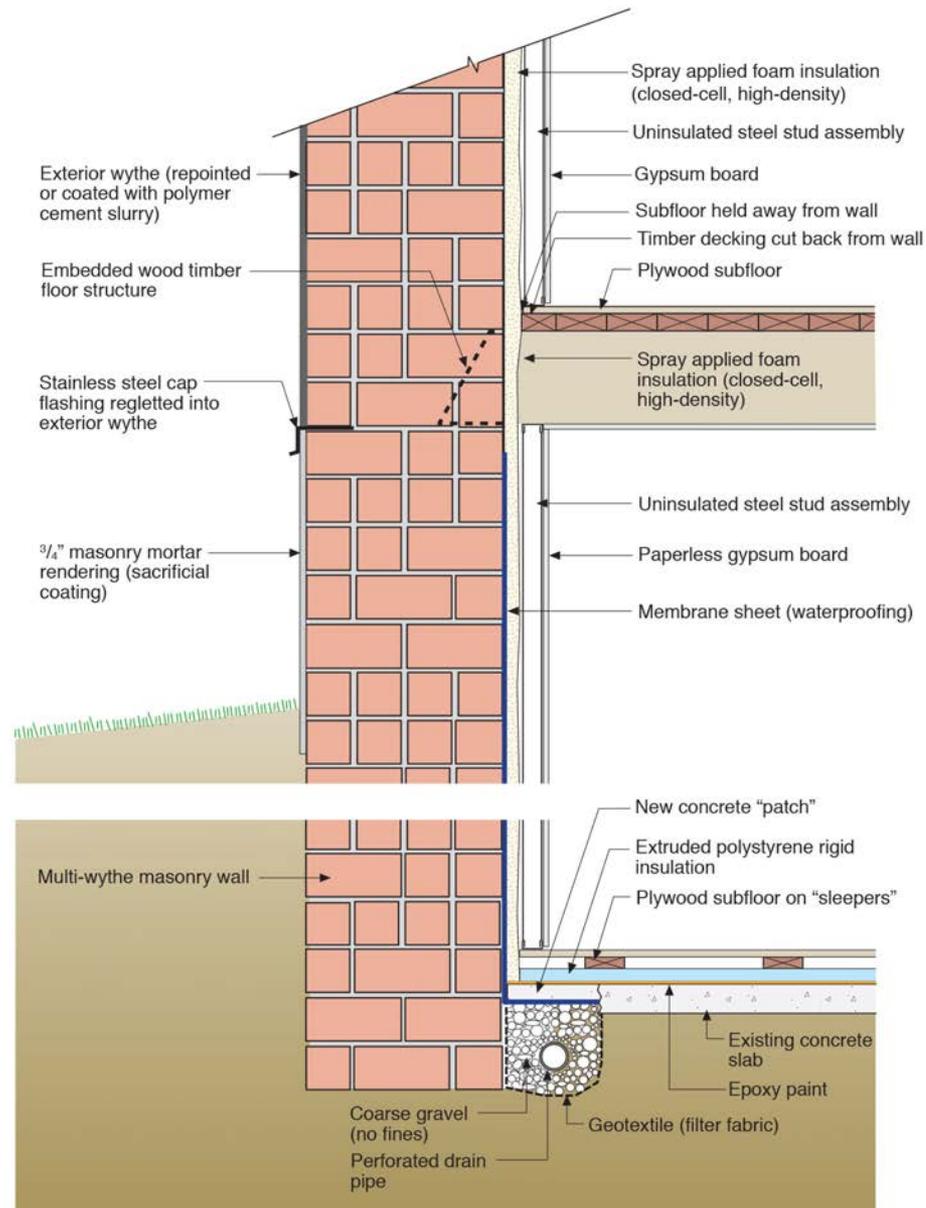

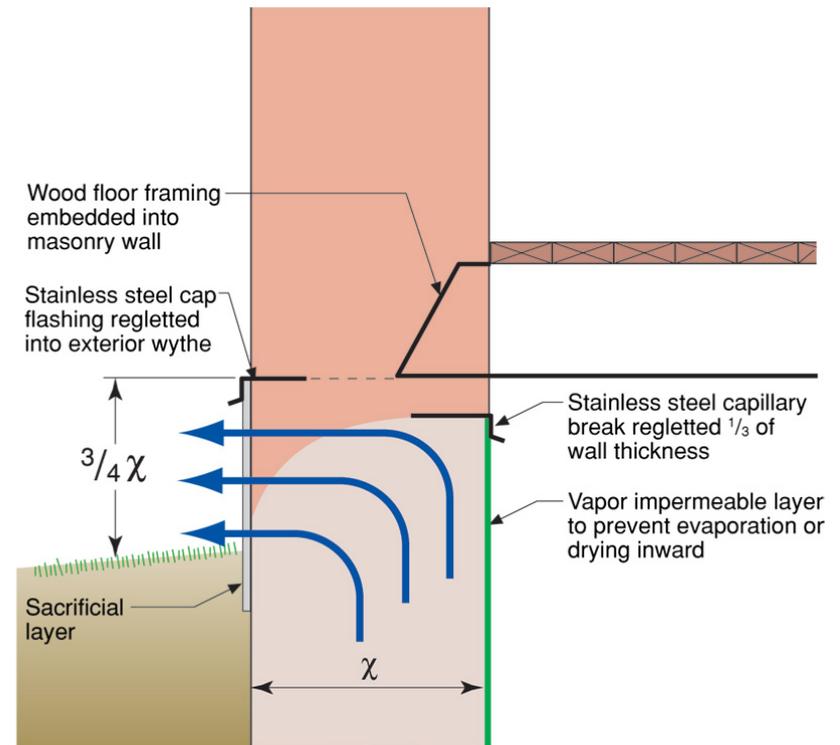

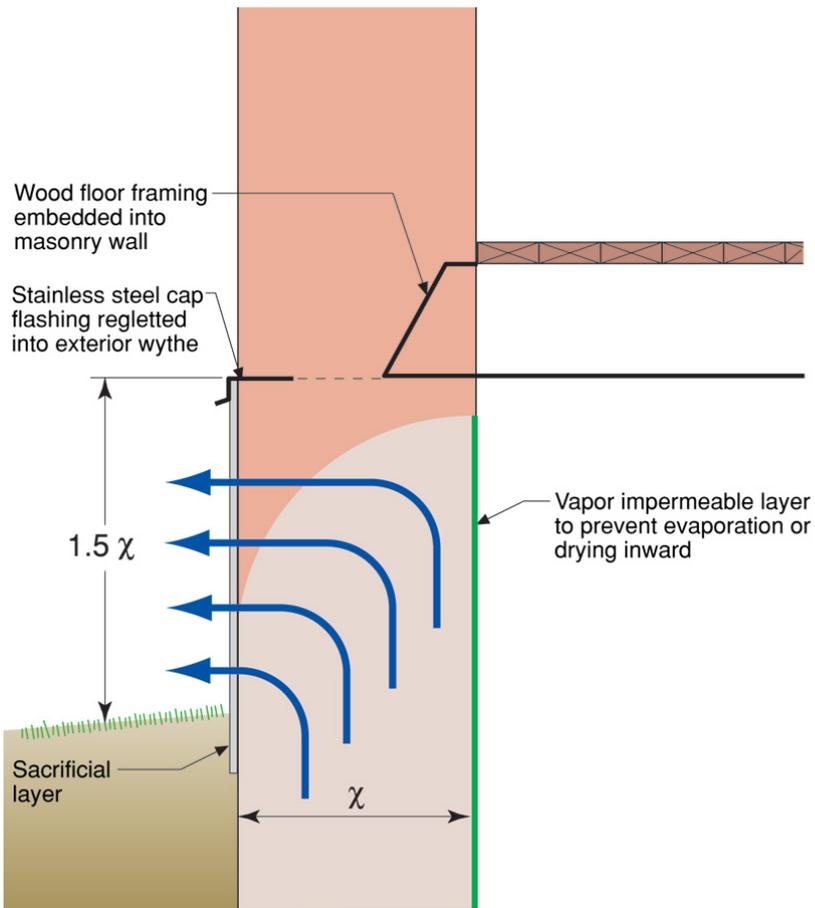

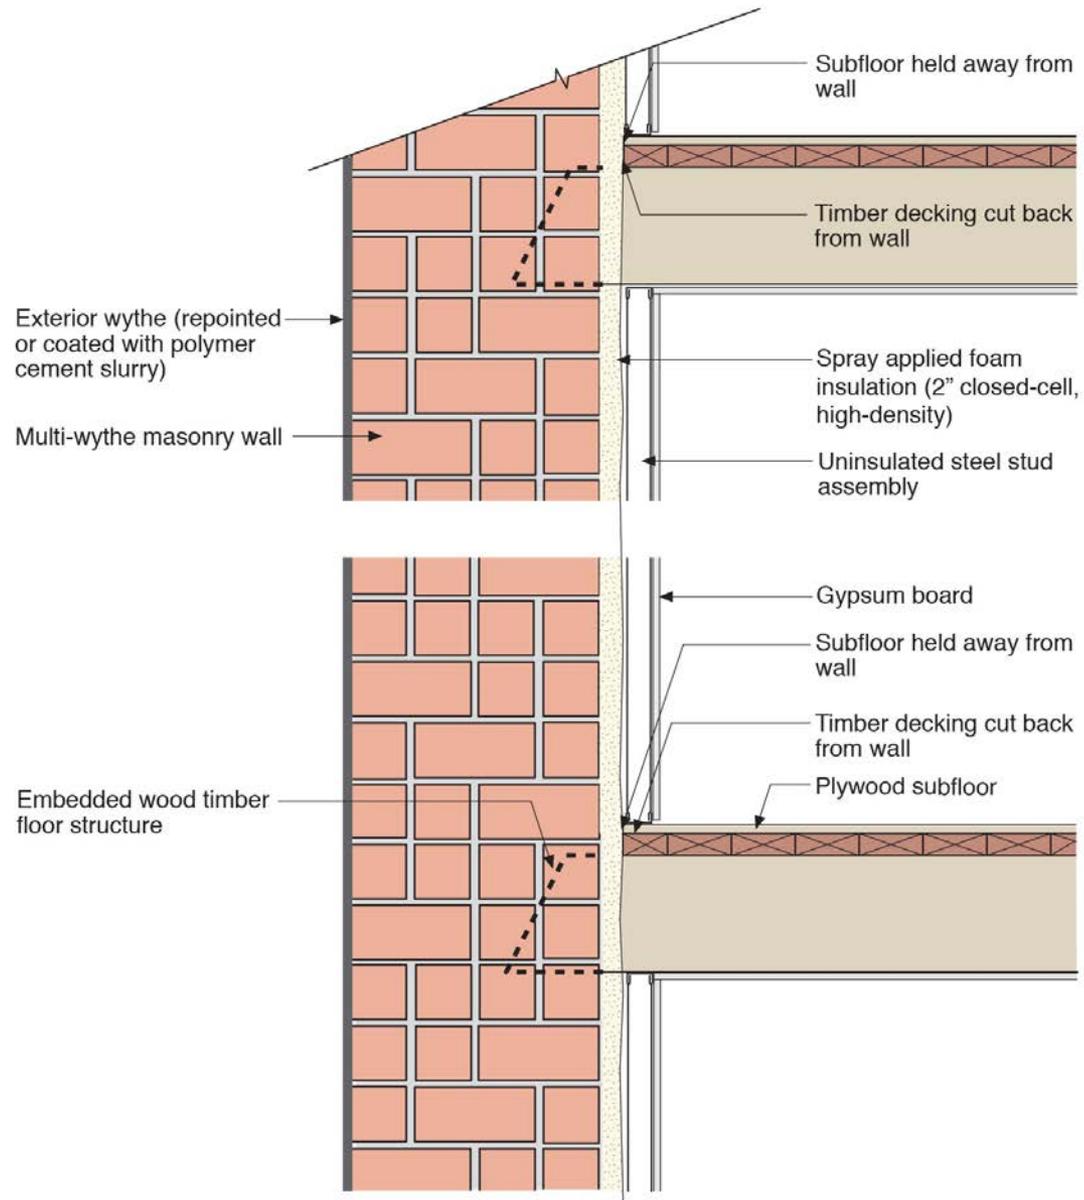

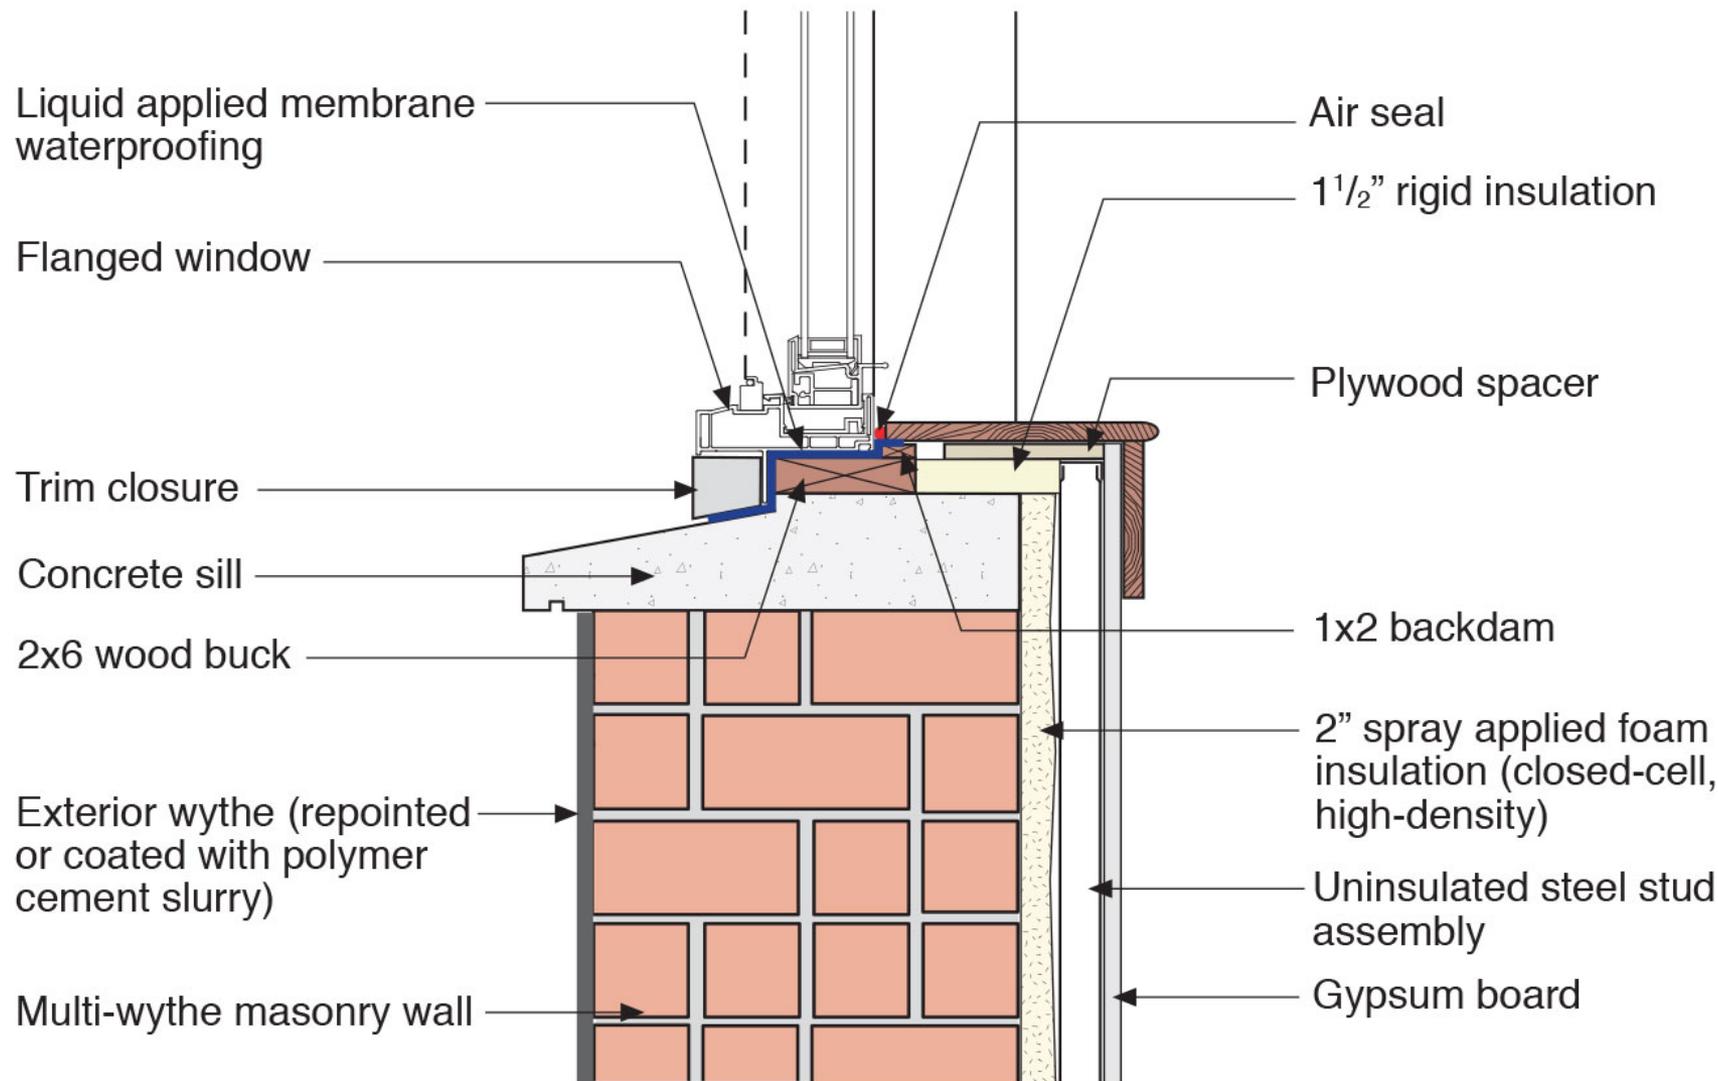

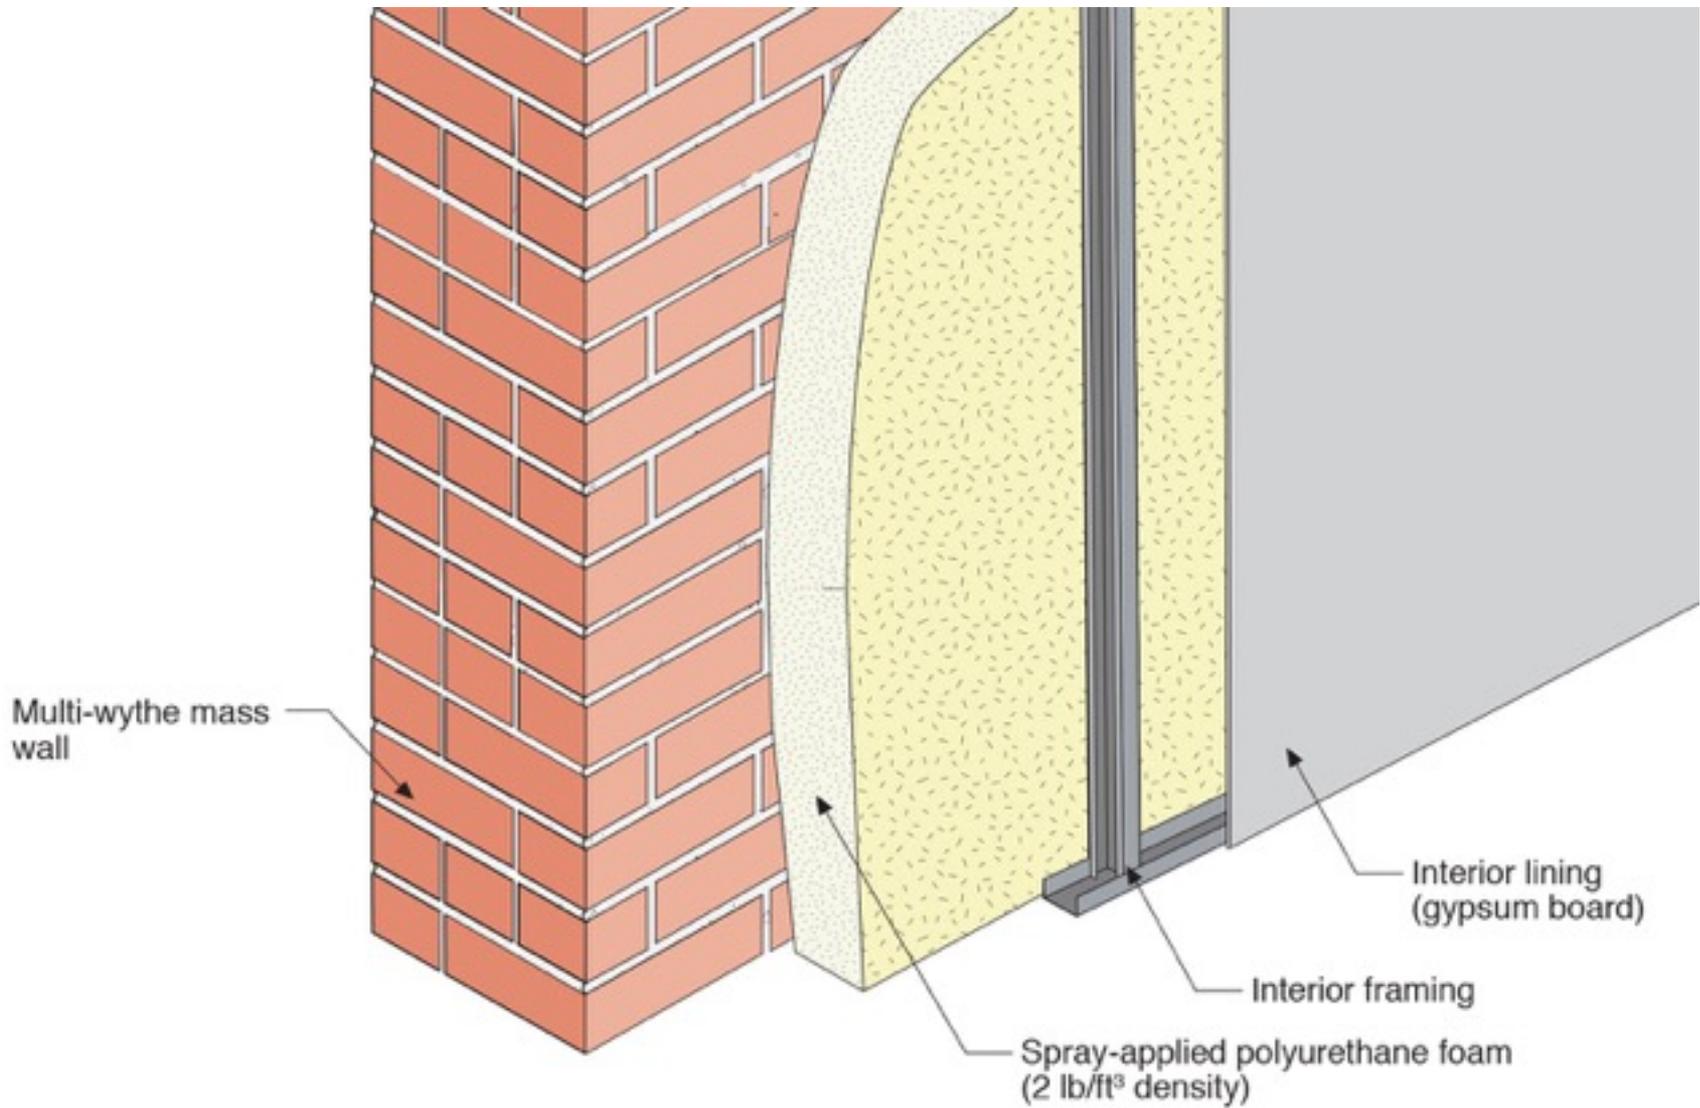

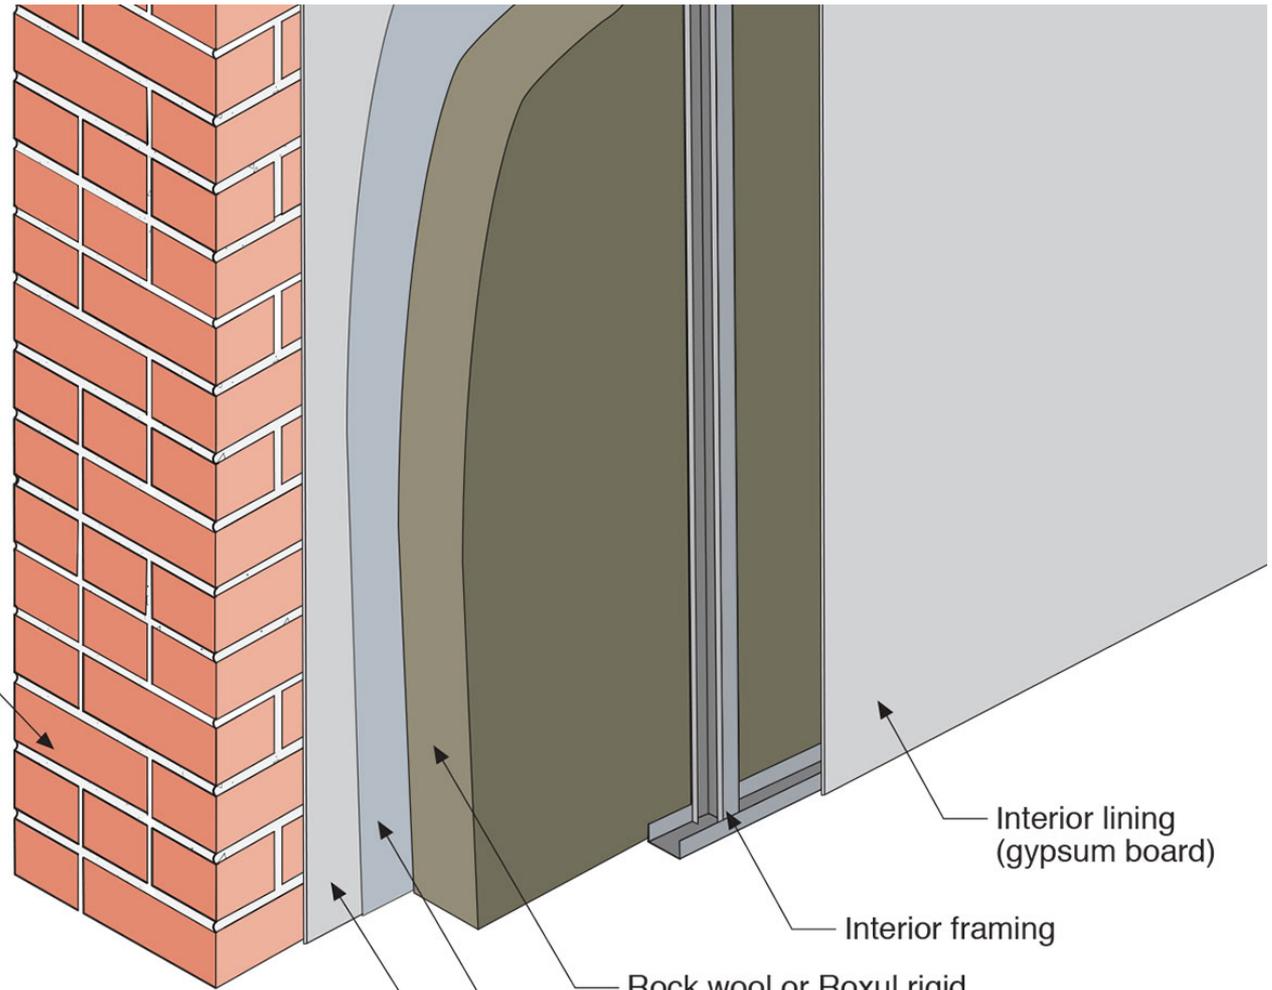

Multi-wythe mass wall

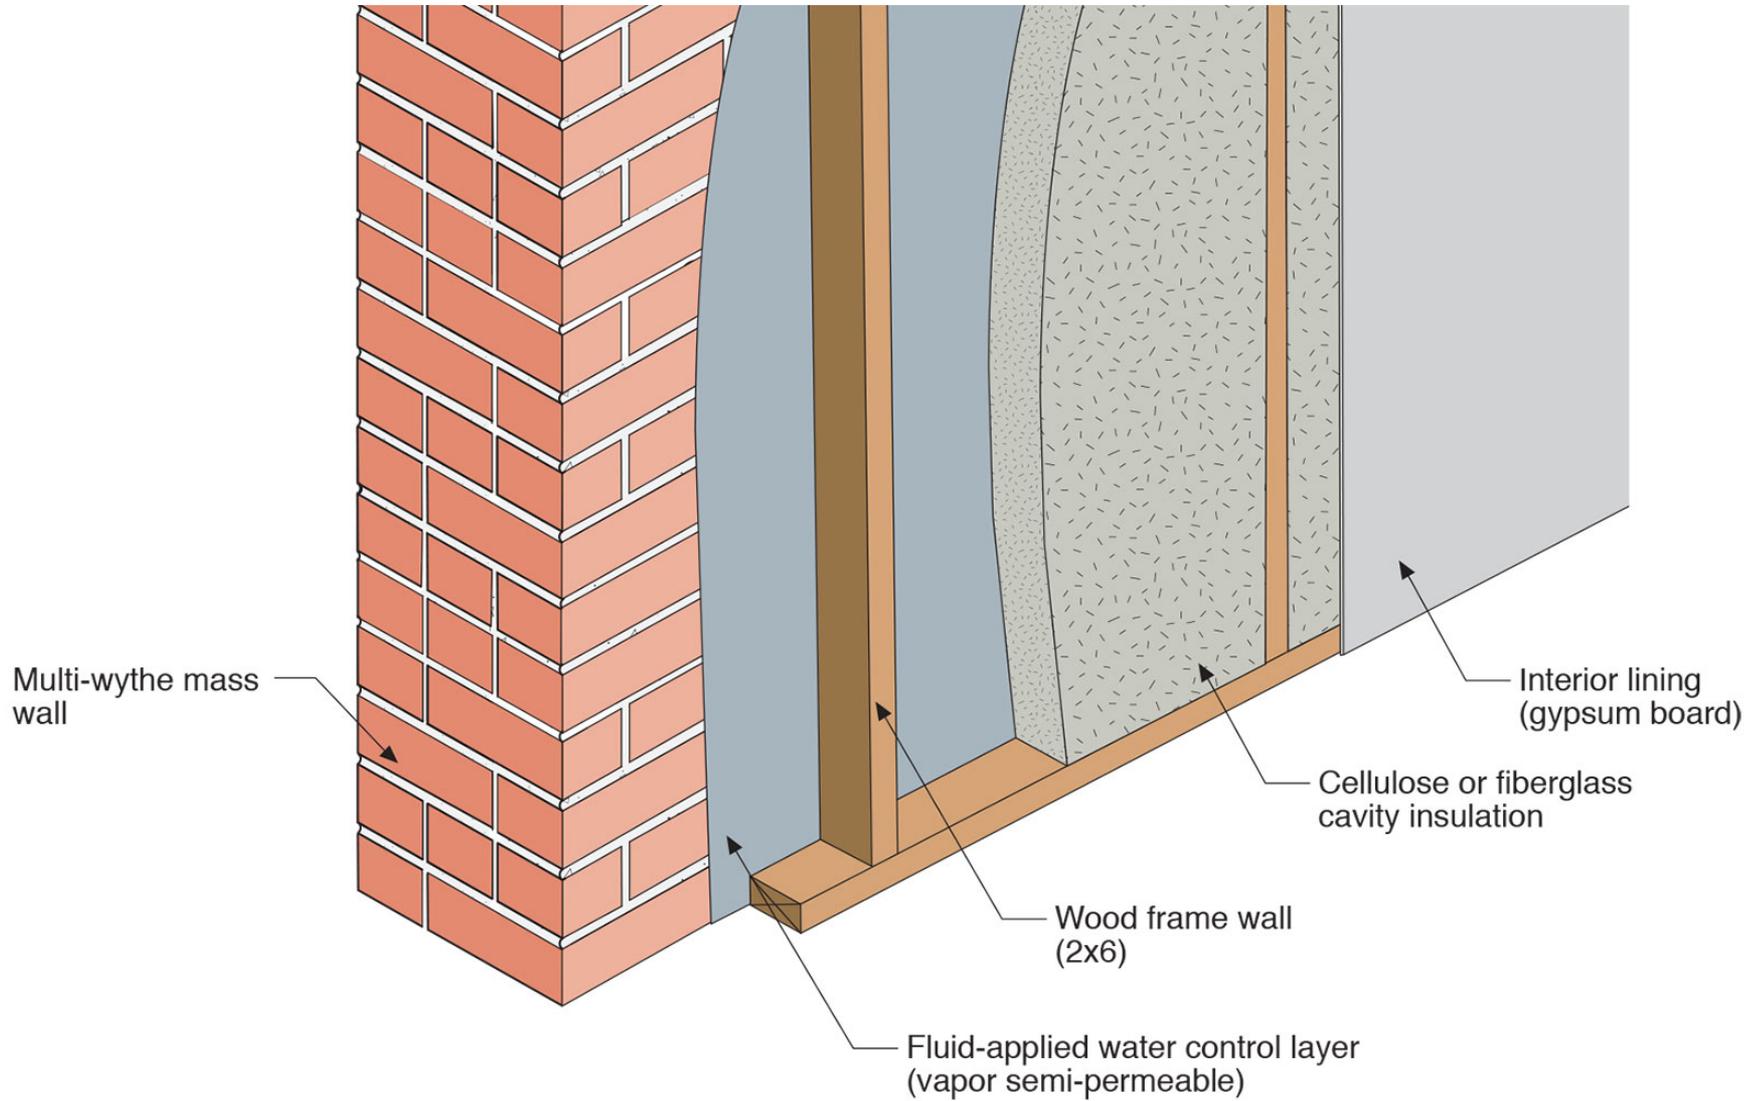

Interior lining (gypsum board)

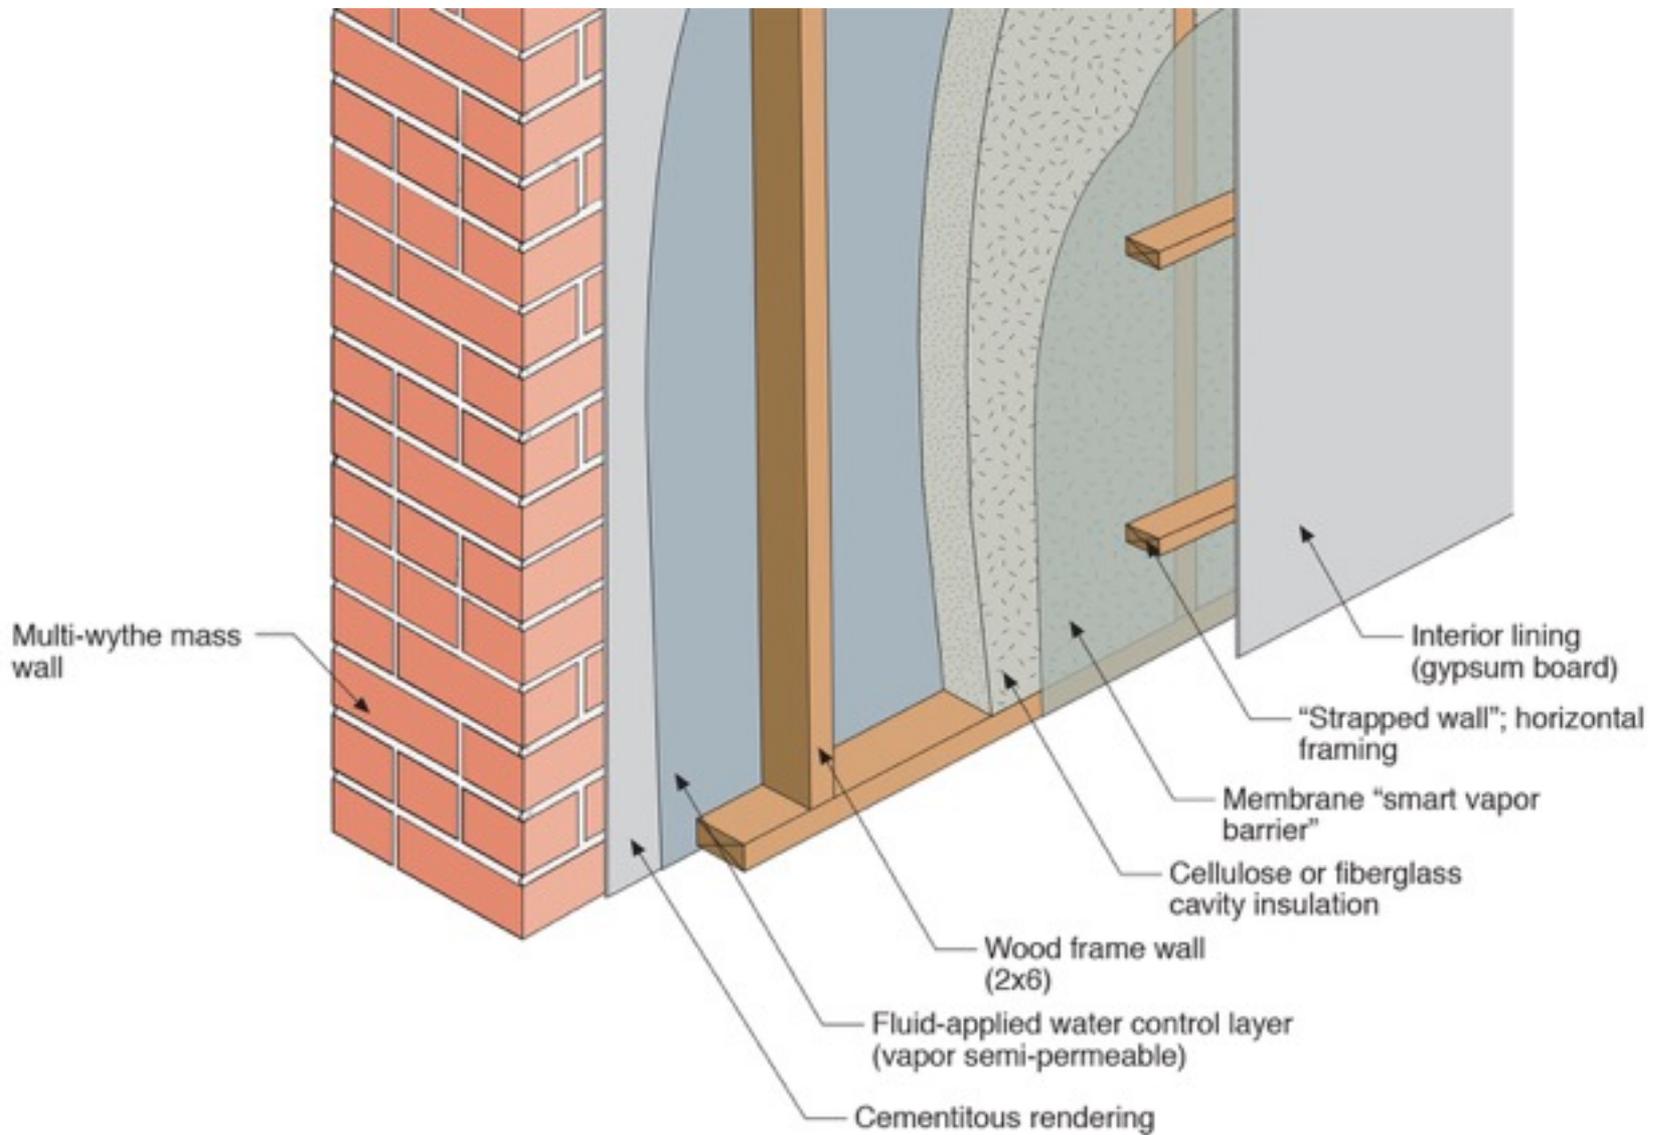

Interior framing

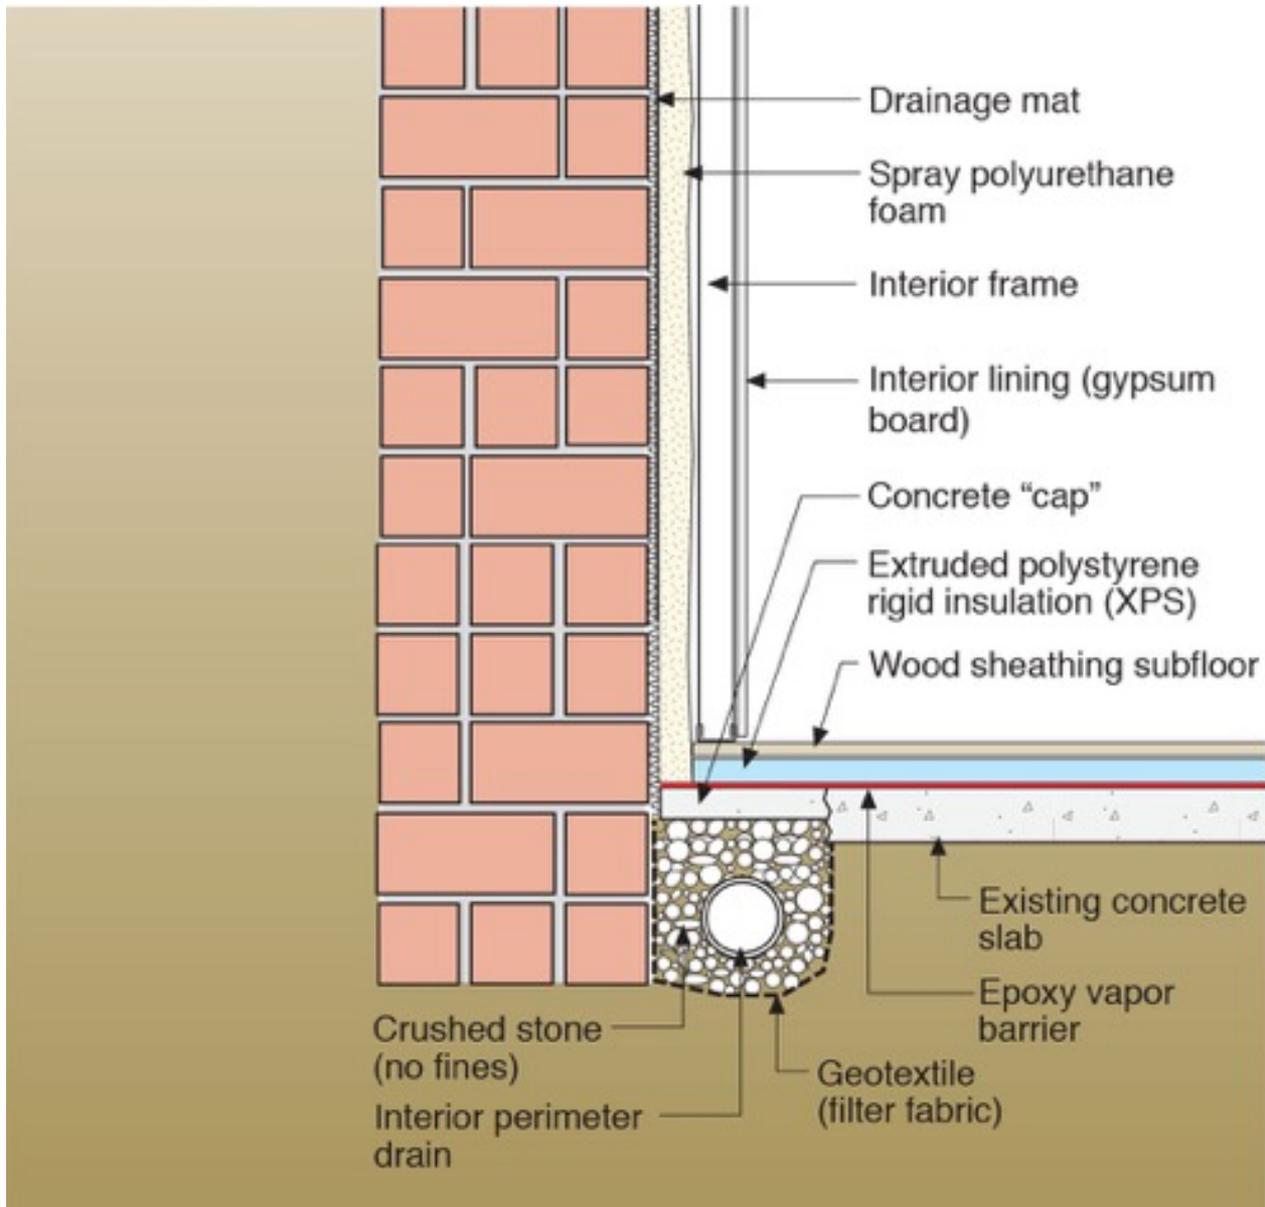

Rock wool or Roxul rigid mineral wool insulation

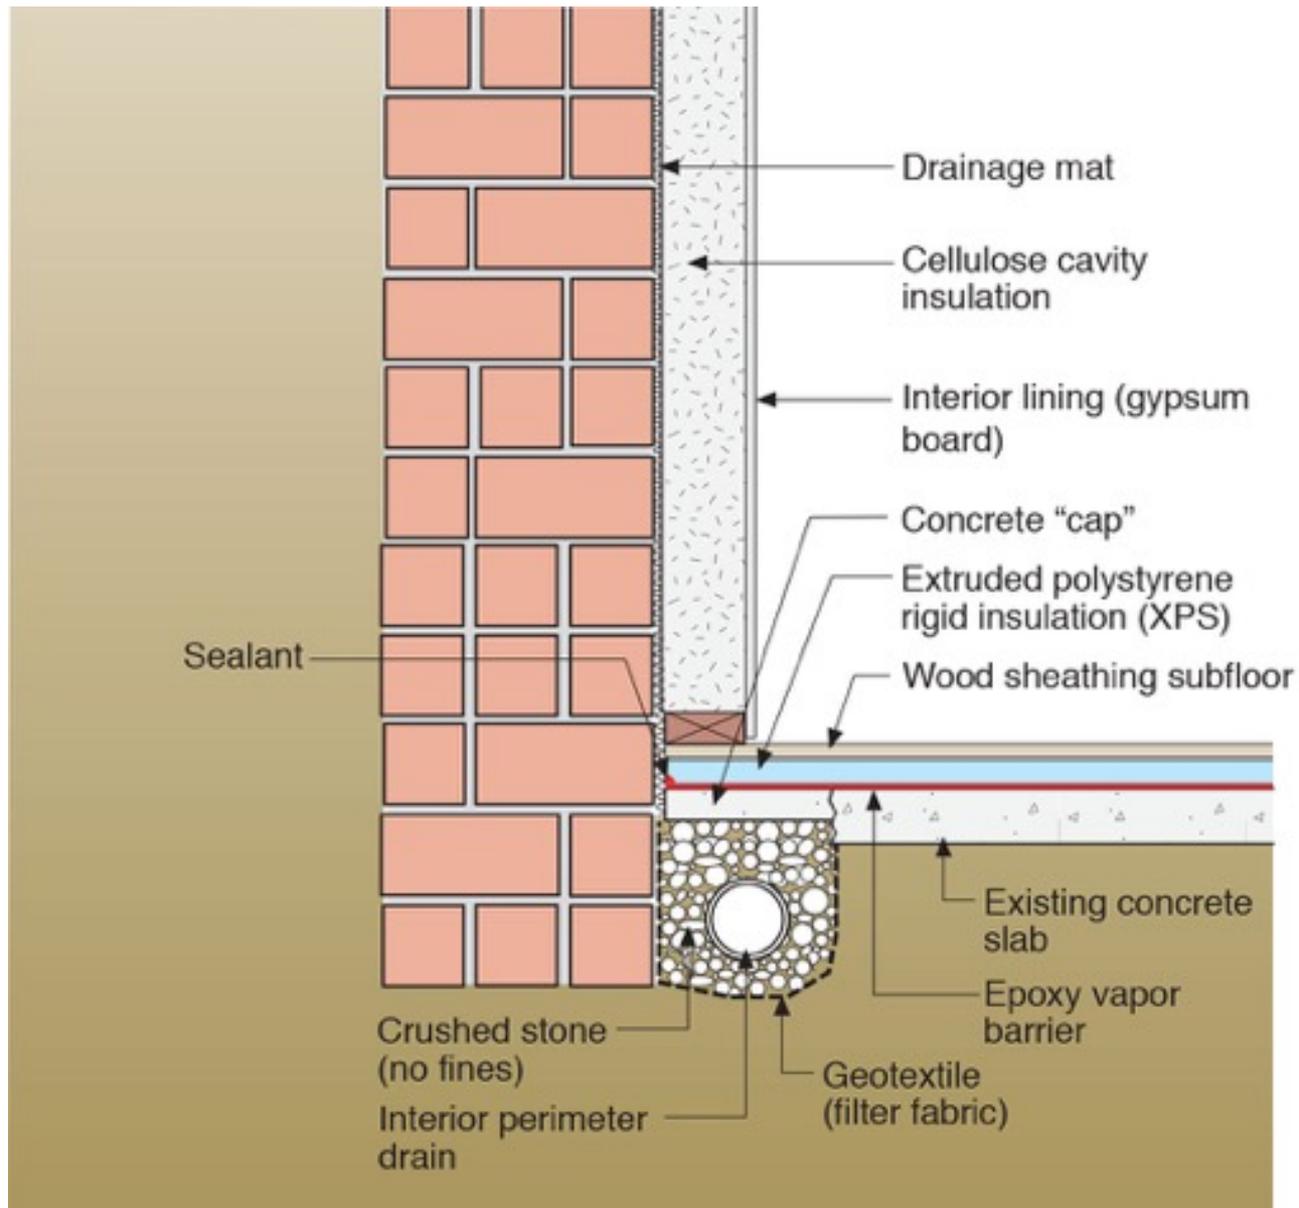

Fluid-applied water control layer (vapor semi-permeable)

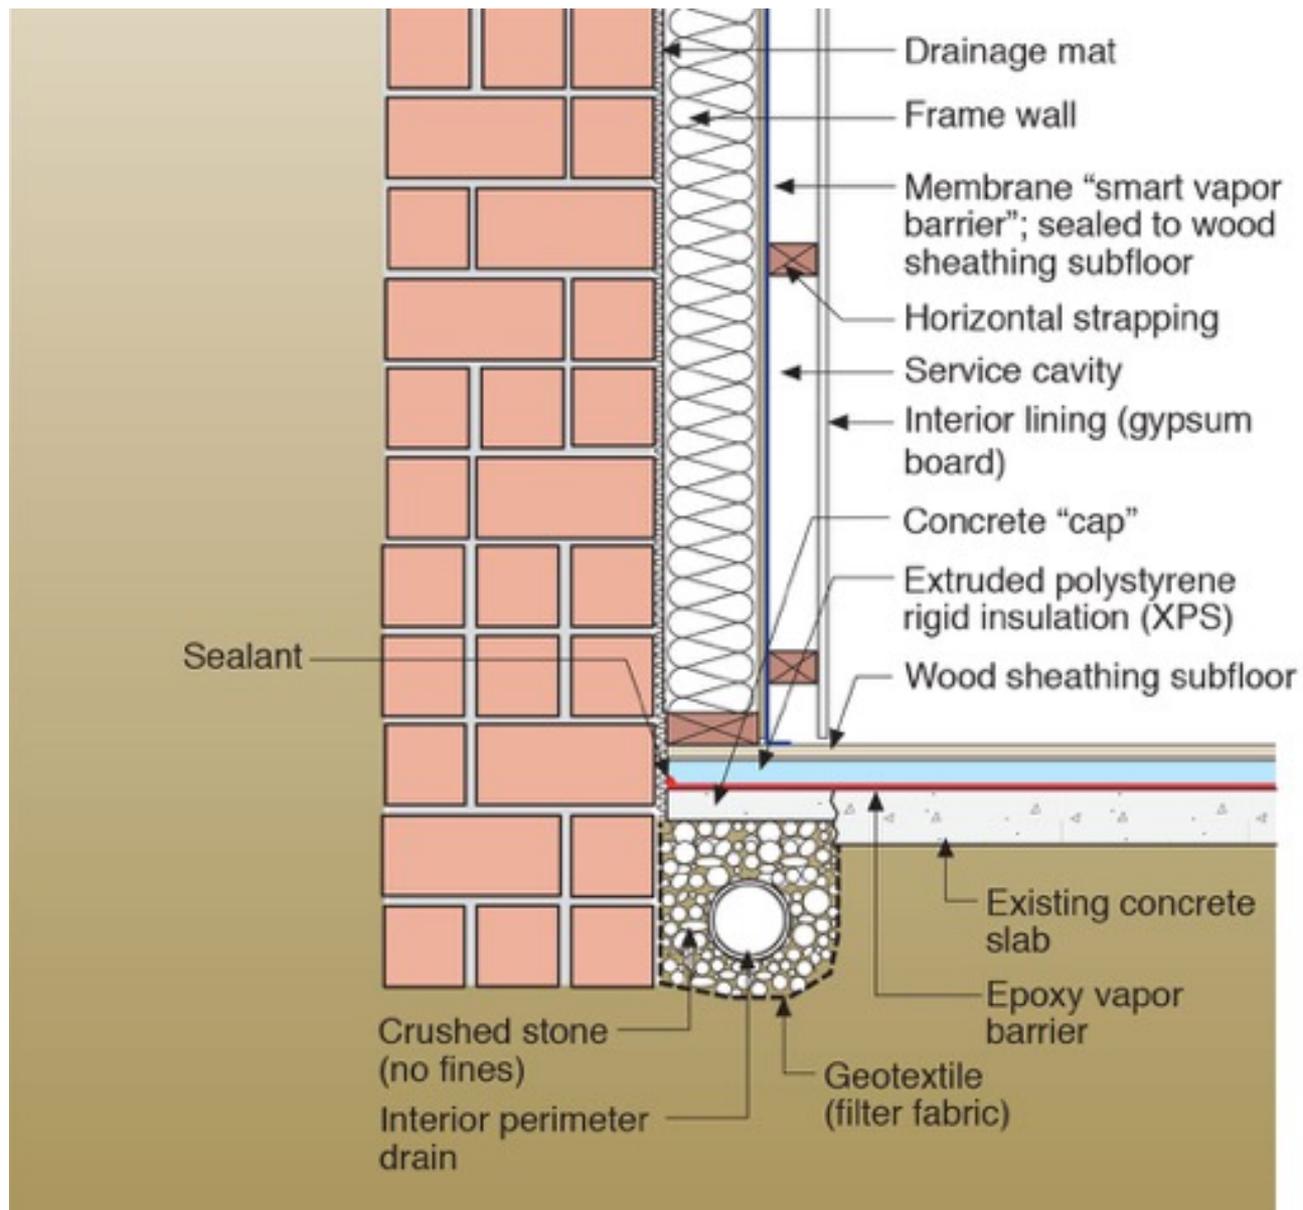

Cementitious rendering

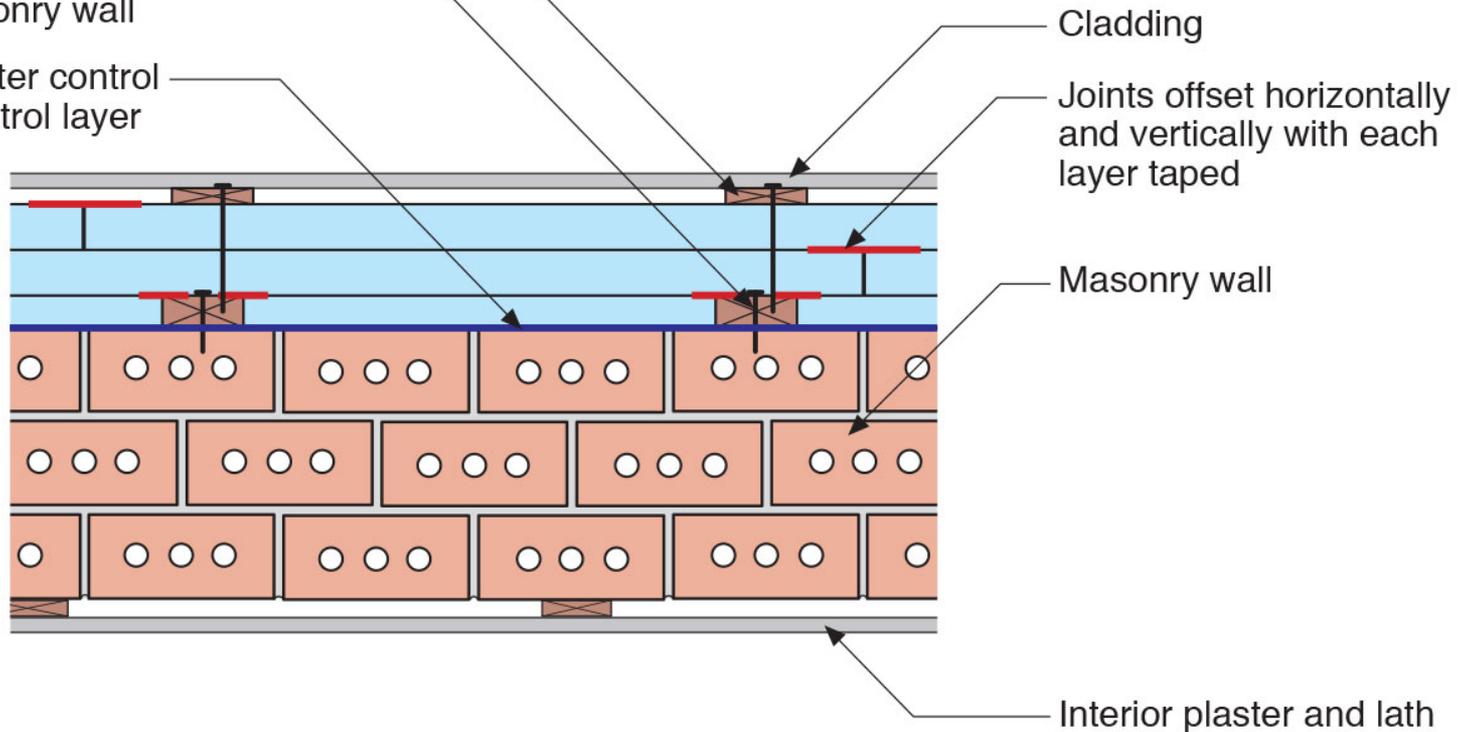

1x4 wood furring attached through rigid insulation to 2x4 wood furring

2x4 wood furring mechanically attached to masonry wall

Fluid-applied water control layer and air control layer

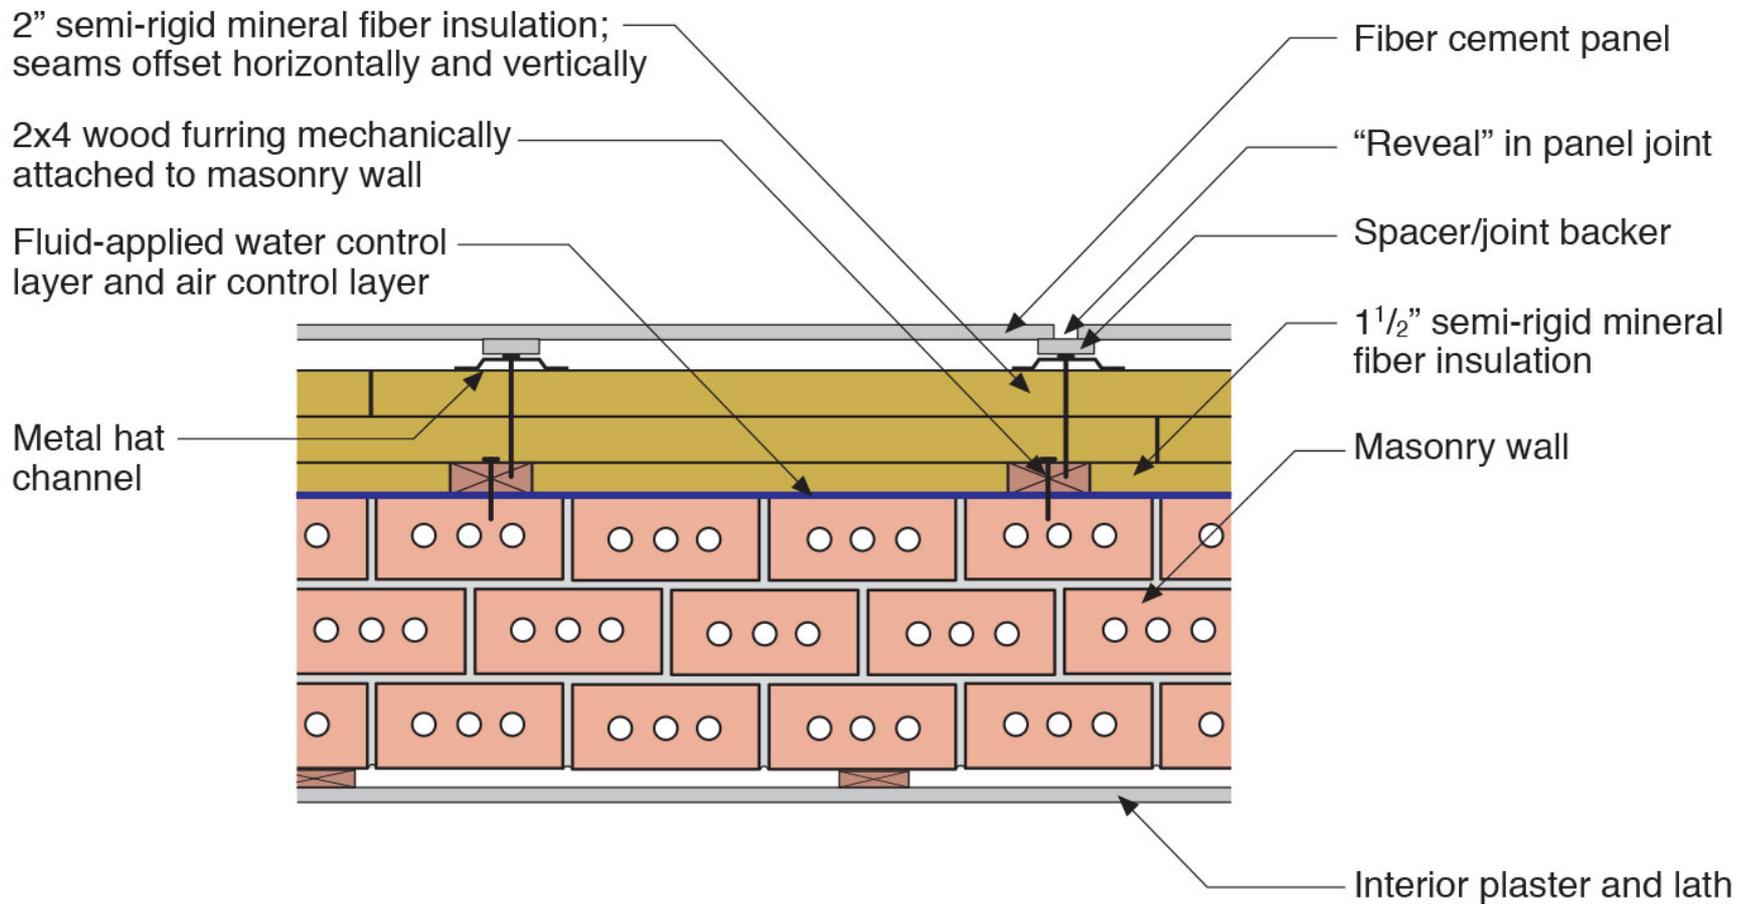

Cladding

Joints offset horizontally and vertically with each layer taped

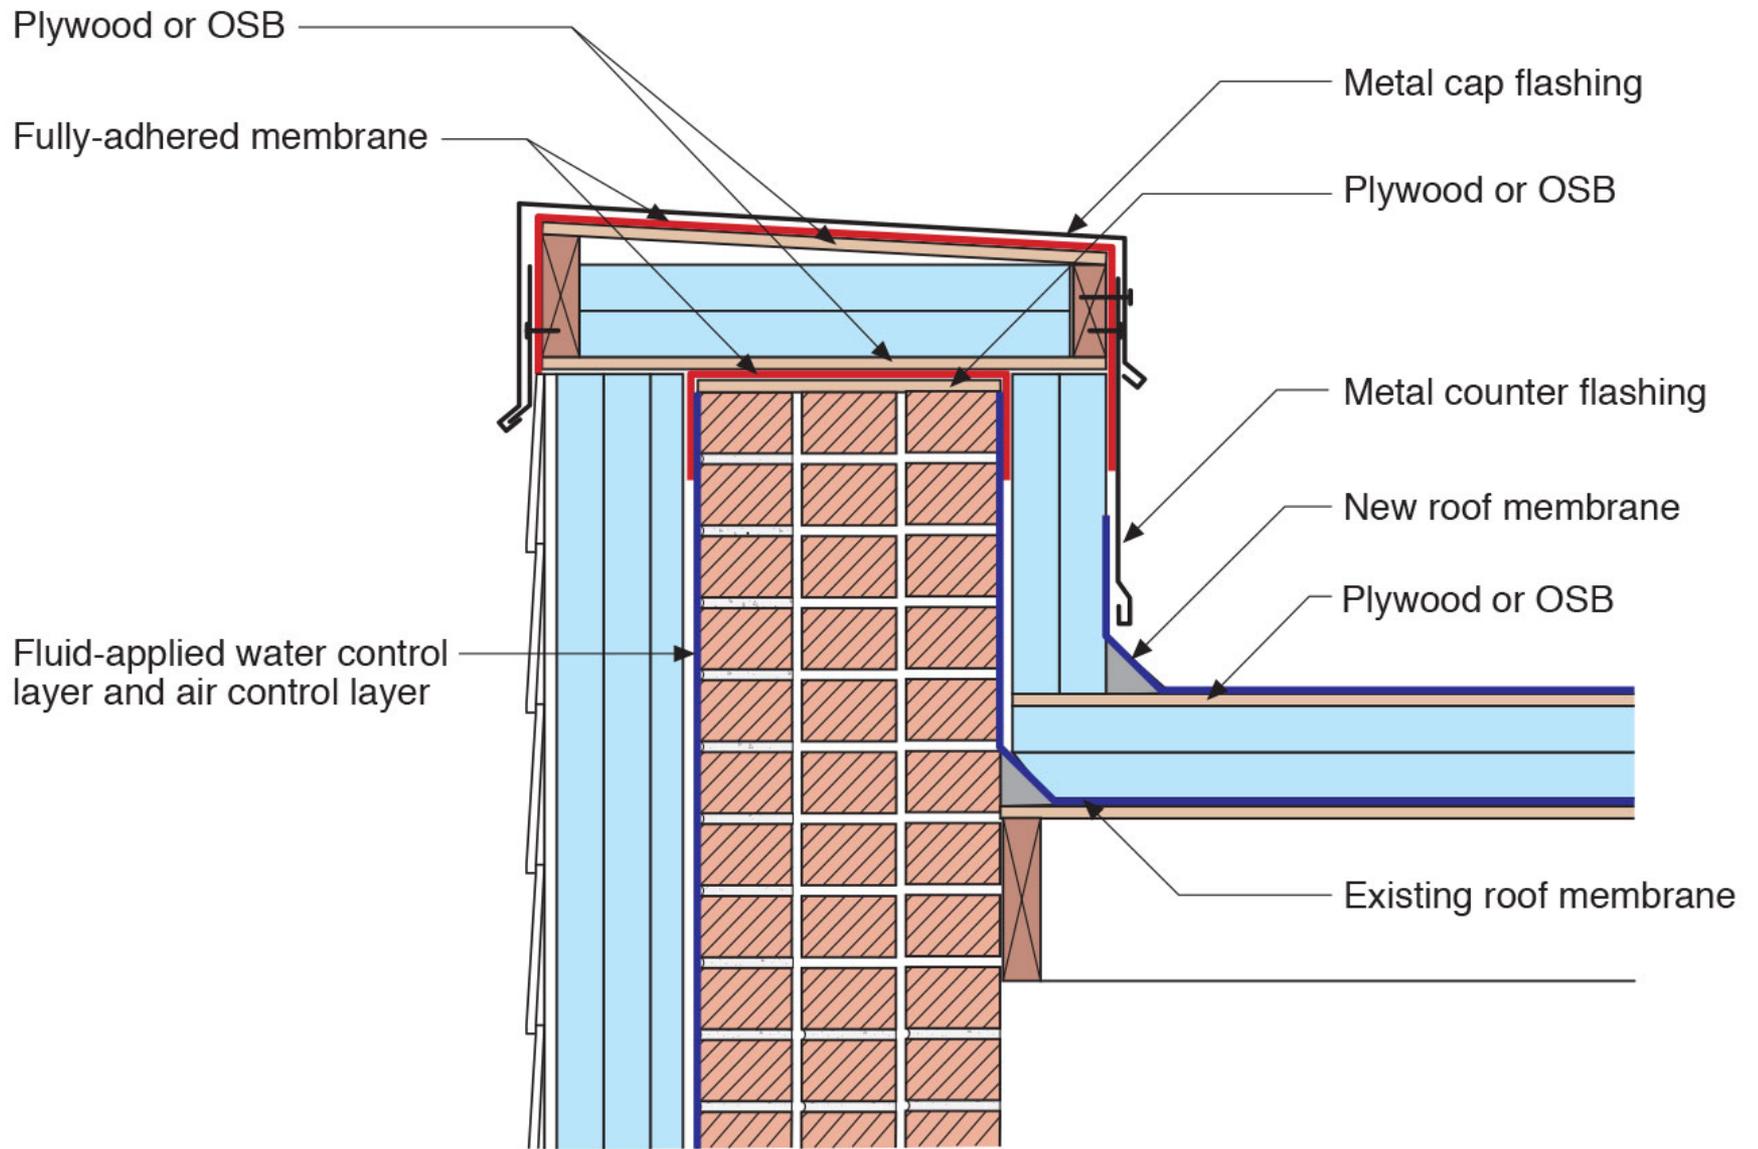

Masonry wall

Interior plaster and lath

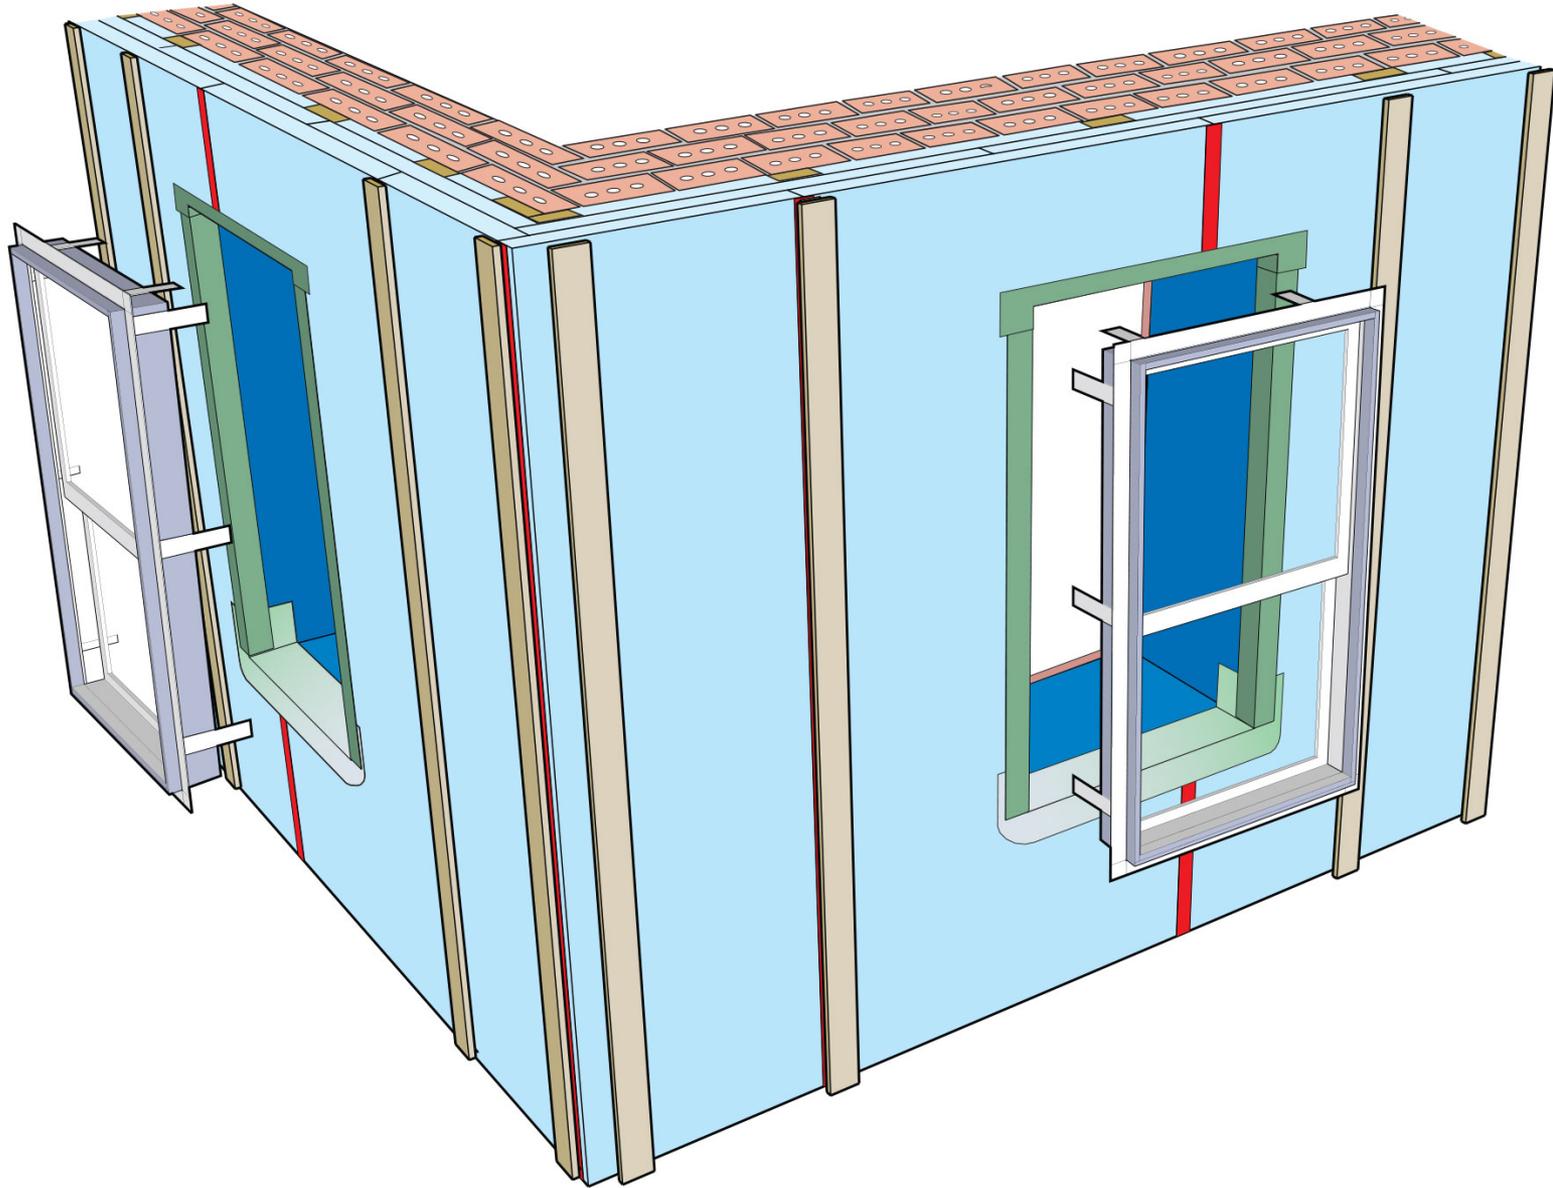

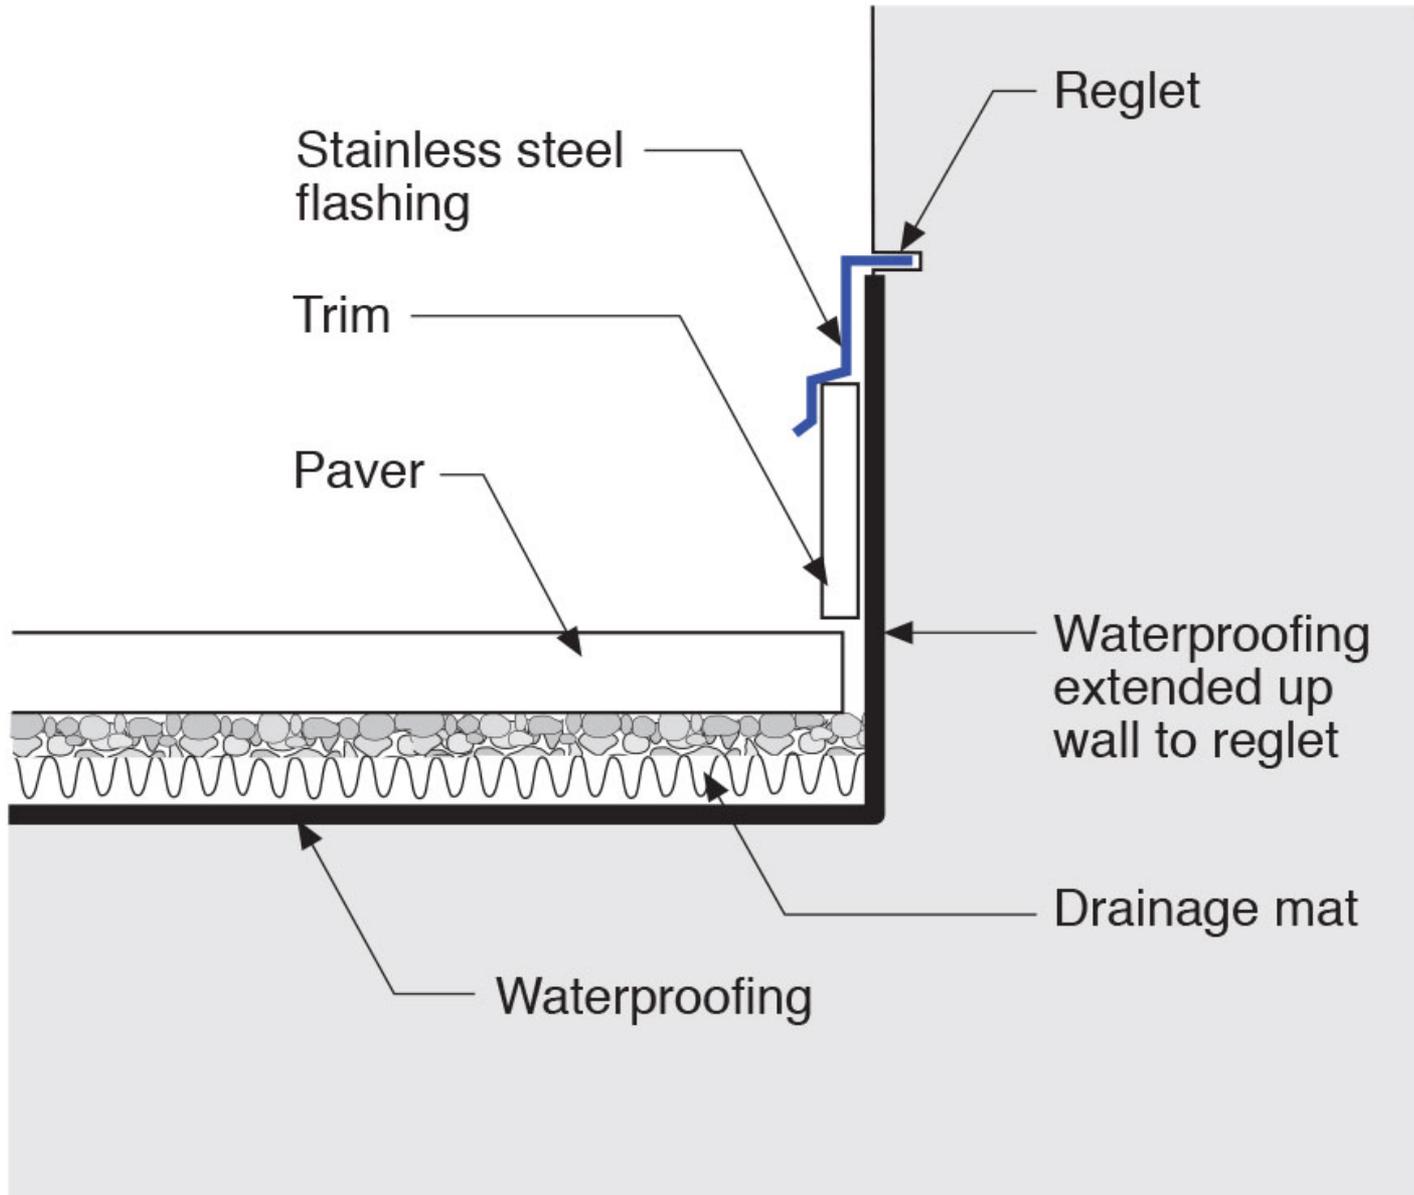

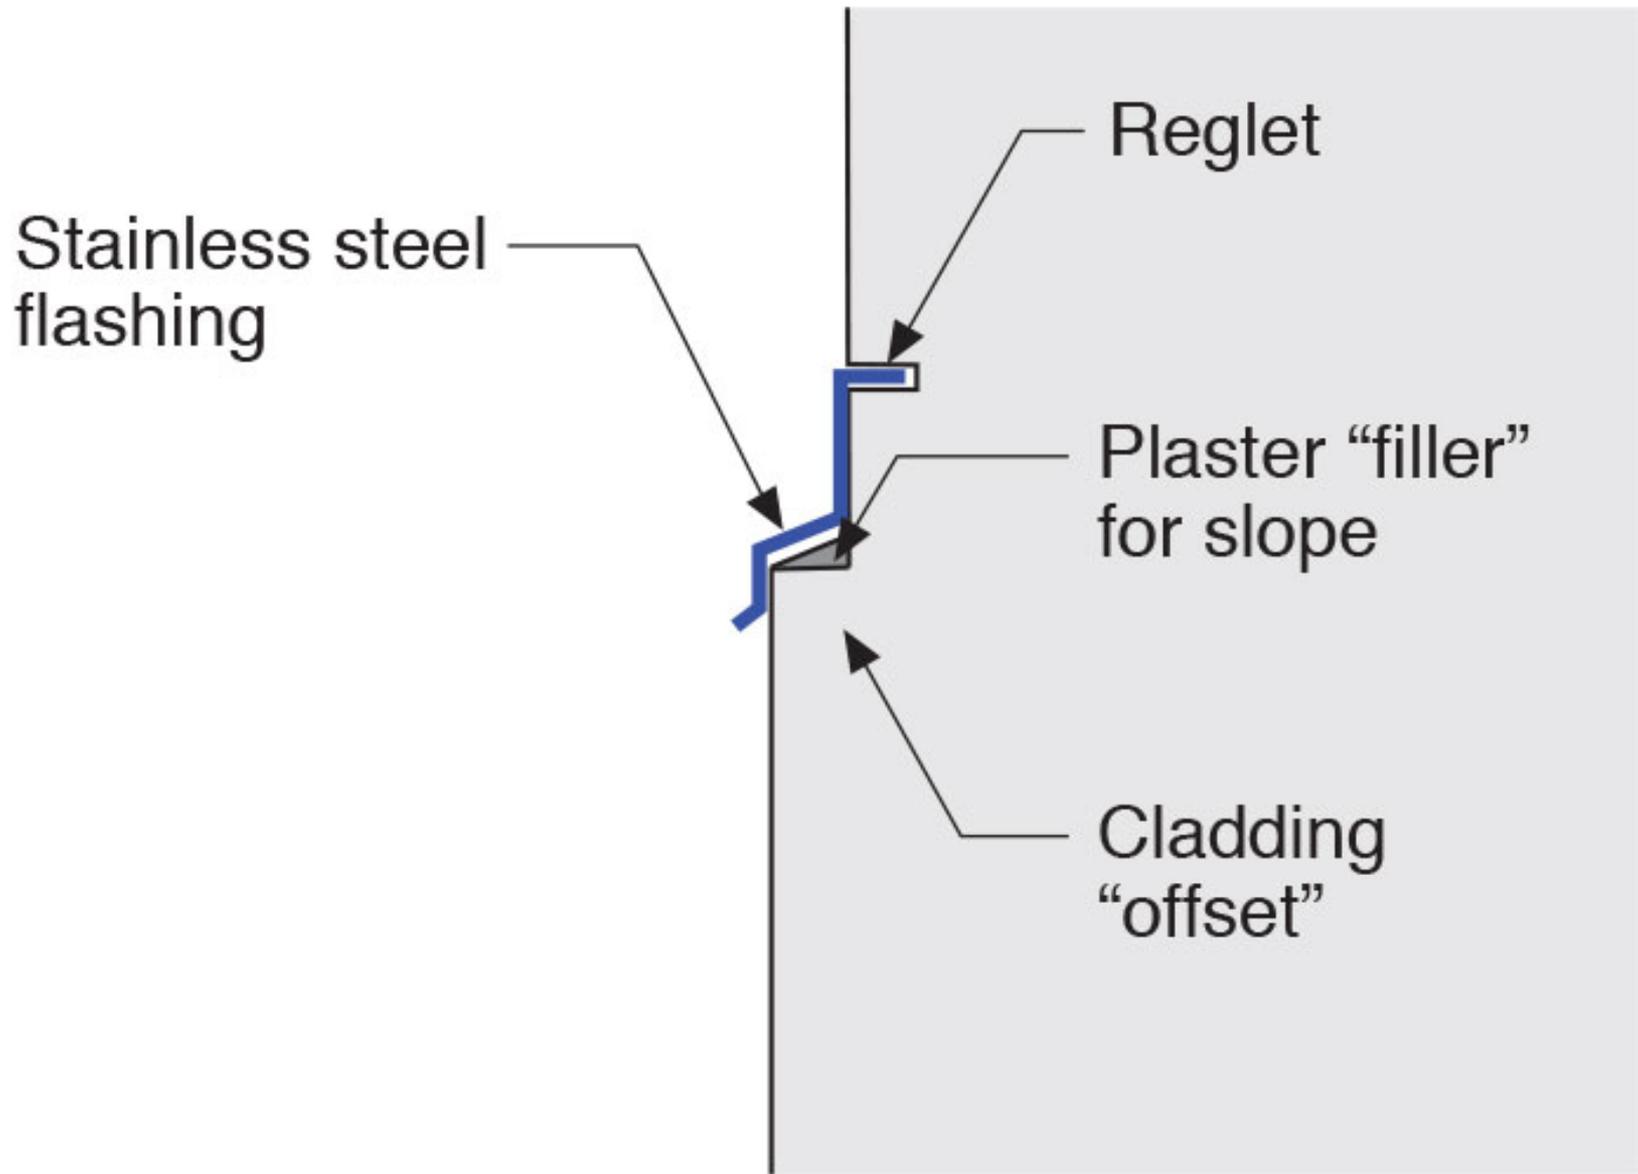

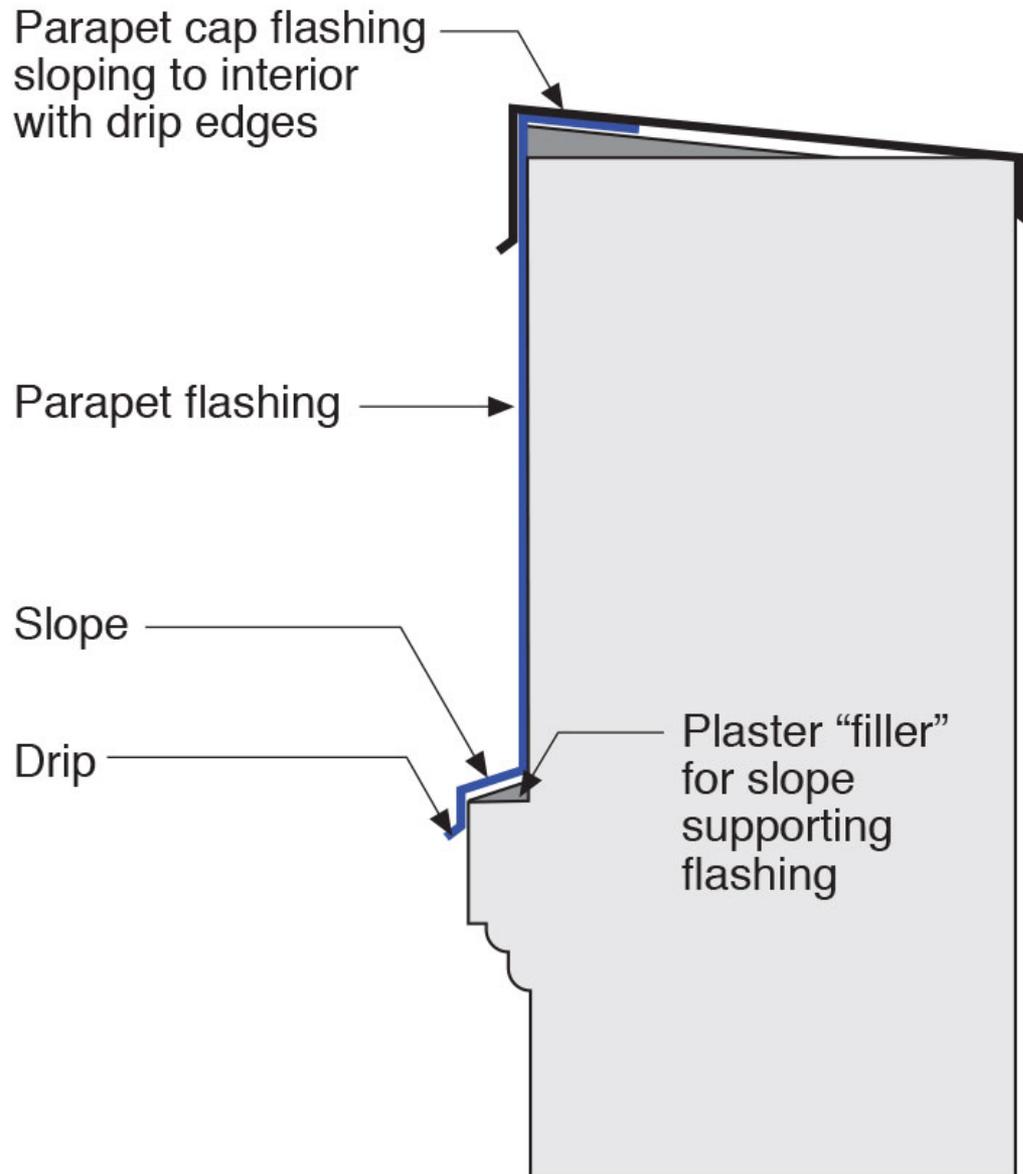

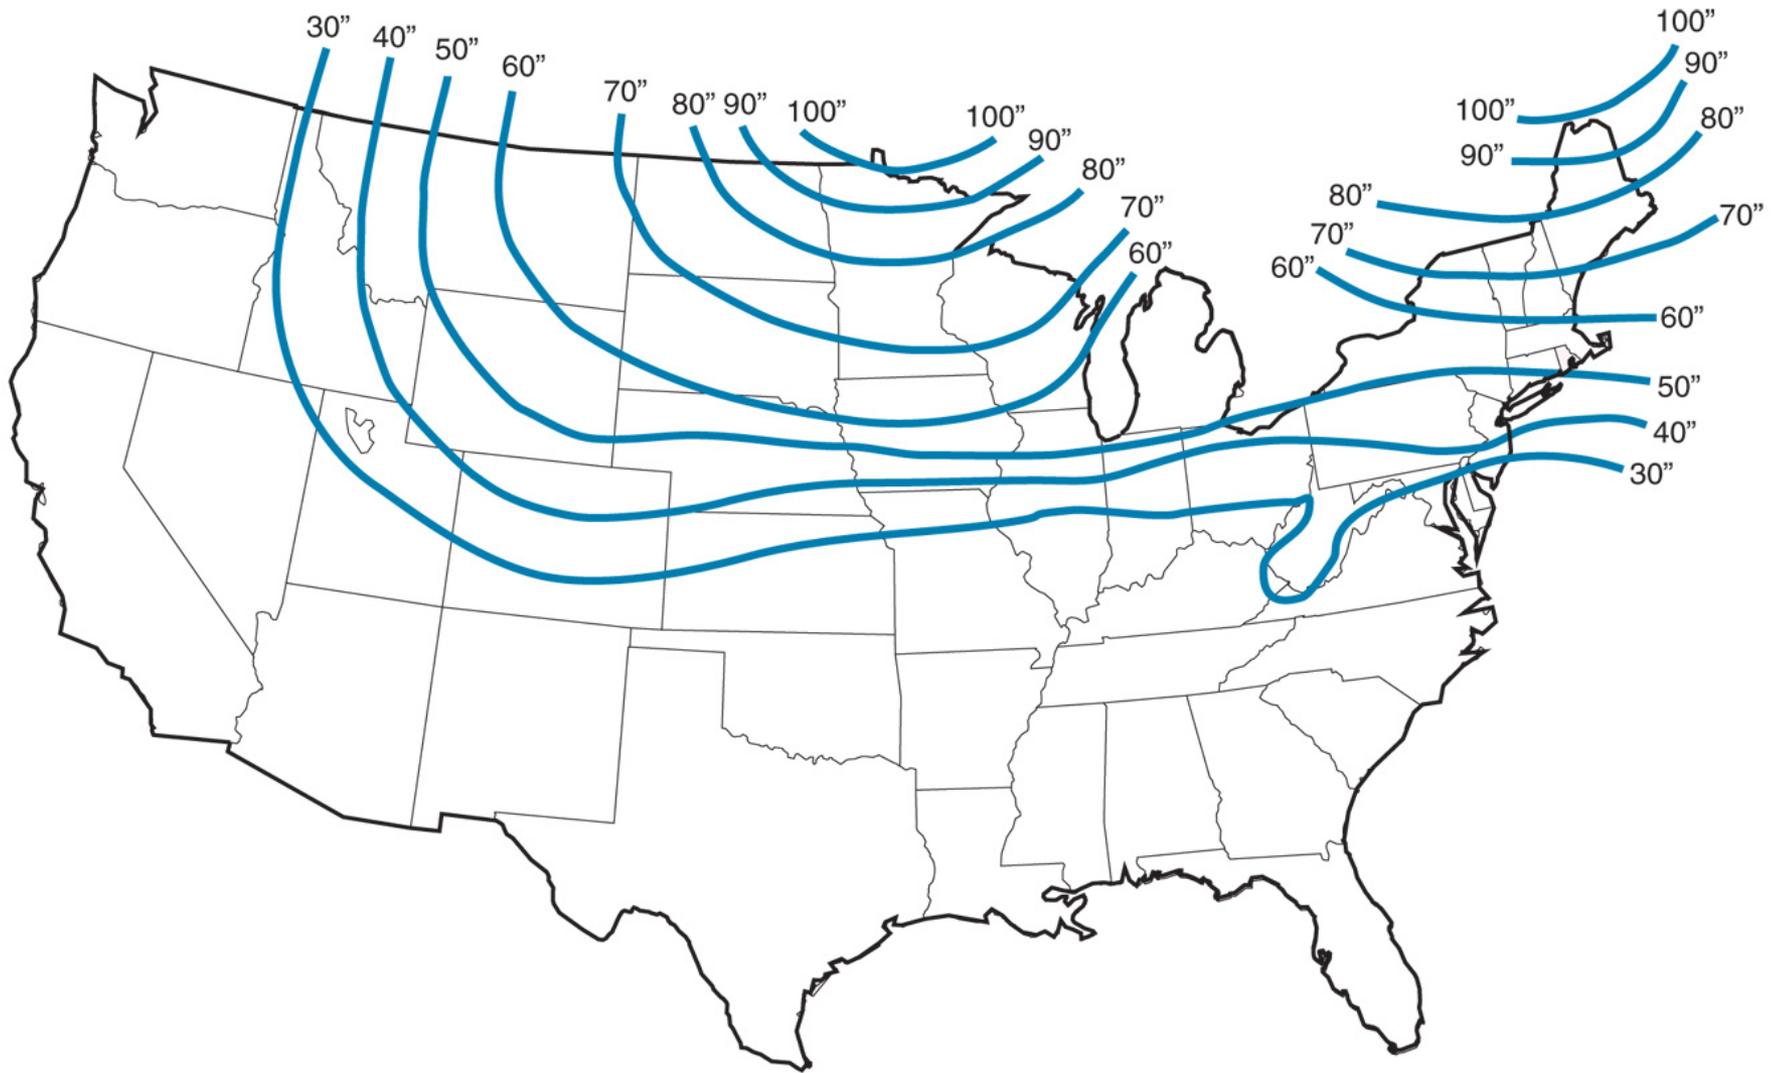

From the US Army Corps Engineers Extreme Frost Penetration (in inches) based on state averages.
